

## ⚠ WARNING

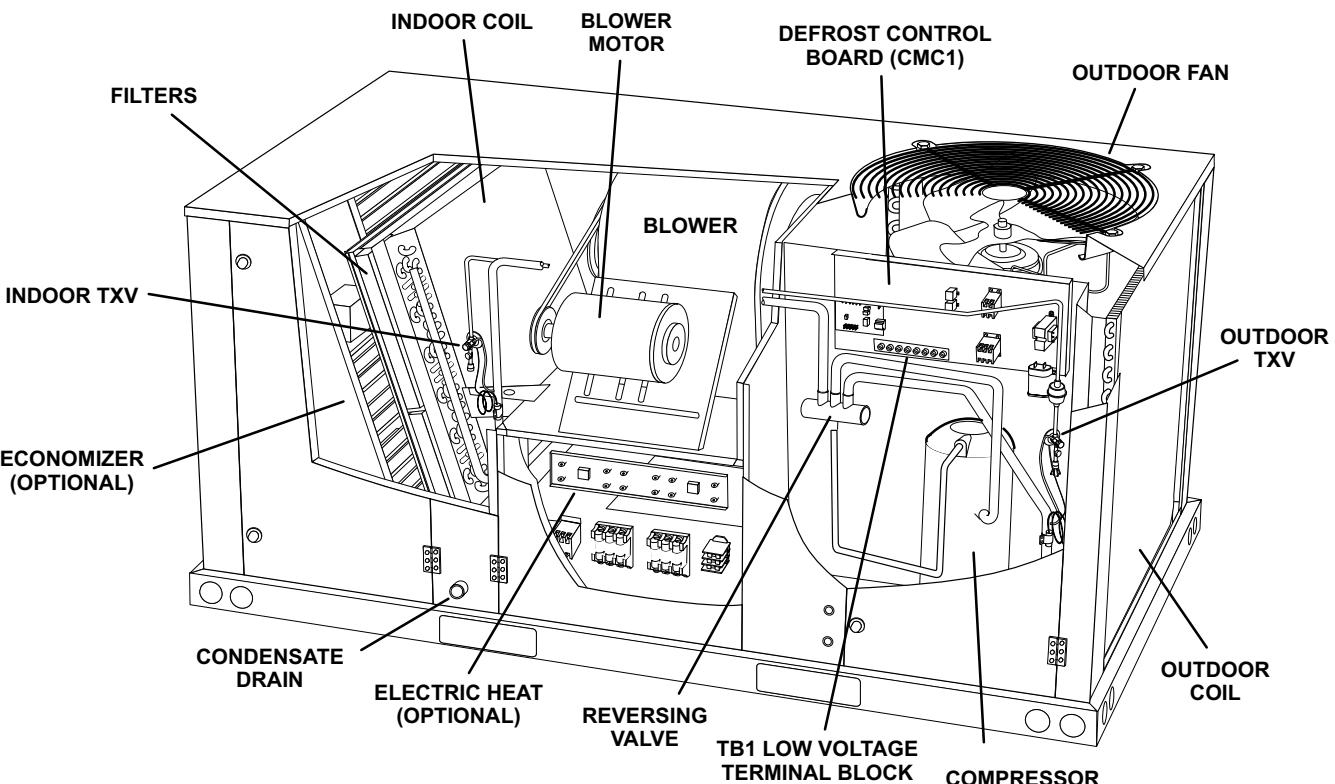

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional HVAC installer or equivalent or service agency.

## Shipping and Packing List

### Package 1 of 1 contains:

1 - Assembled unit

Check unit for shipping damage. Receiving party should contact last carrier immediately if shipping damage is found.

## General

These instructions are intended as a general guide and do not supersede local codes in any way. Authorities having jurisdiction should be consulted before installation.

The KHA standard efficiency unit is available in a 6-ton cooling capacity. KHB standard efficiency units are available in 2, 2-1/2, 3, 4, 5 and 6-ton cooling capacities. KHB high efficiency units are available in 2, 3, 4 and 5 ton cooling capacities. Optional electric heat is available.

KHB high efficiency units have multi-tap, direct drive supply air blower and condenser fan motors. KHB high efficiency units are available equipped with a belt drive, two-speed, supply air blower. KHB high efficiency units will operate at lower speeds when cooling demand is low and increase to higher speeds when cooling demand is high.

Availability of units and options varies by brand.

## Requirements

The KH unit is ETL/CSA certified as a heat pump with cooling and with or without auxiliary electric heat for non-residential use only at the clearances to combustible materials as listed on the unit nameplate and in figure 1.

Installation of KH heat pumps must conform with standards in National Fire Protection Association (NFPA) "Standard for Installation of Air Conditioning and Ventilating Systems NFPA No. 90A," "Standard for Installation of Residence Type Warm Air Heating and Air conditioning Systems NFPA No. 90B," local municipal building codes and manufacturer's installation instructions.

The National Electric Code (ANSI/NFPA No. 70-1984) is available from:

National Fire Protection Association  
1 Batterymarch Park  
PO Box 9101  
Quincy, MA 02269-9101

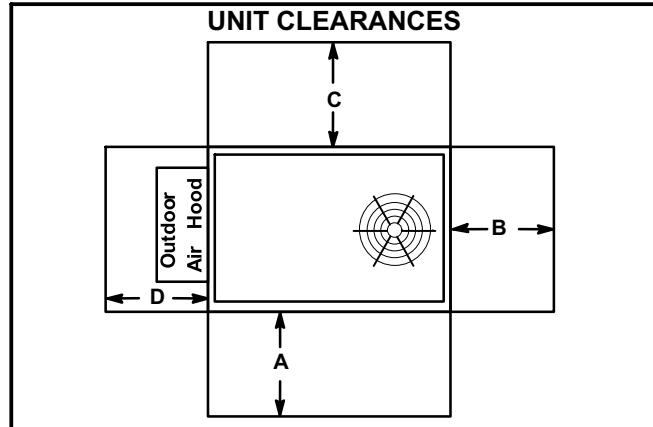

FIGURE 1

1 <sup>Unit Clearance</sup>	A in. (mm)	B in. (mm)	C in. (mm)	D in. (mm)	Top Clearance
Service Clearance	36 (914)	36 (914)	36 (914)	36 (914)	Unobstructed
Minimum Operation Clearance	36 (914)	36 (914)	36 (914)	36 (914)	Unobstructed

Note - Entire perimeter of unit base requires support when elevated above mounting surface.

<sup>1</sup> Service Clearance - Required for removal of serviceable parts.

Minimum Operation Clearance - Required clearance for proper unit operation.

## NOTICE

### Roof Damage!

This system contains both refrigerant and oil. Some rubber roofing material may absorb oil, causing the rubber to swell. Bubbles in the rubber roofing material can cause leaks. Protect the roof surface to avoid exposure to refrigerant and oil during service and installation. Failure to follow this notice could result in damage to roof surface.

Installation of ETL/CSA certified units must also conform with current standard C273.5 "Installation Requirements for Heat Pumps" and applicable local codes. Authorities having jurisdiction should be consulted before installation.

Use of this unit as a construction heater or air conditioner is not recommended during any phase of construction. Very low return air temperatures, harmful vapors and operation of the unit with clogged or misplaced filters will damage the unit.

If this unit has been used for heating or cooling of buildings or structures under construction, the following conditions must be met or the warranty will be void:

- A room thermostat must control the unit. The use of fixed jumpers that will provide continuous heating or cooling is not allowed.
- A pre-filter must be installed at the entry to the return air duct.

- The return air duct must be provided and sealed to the unit.
- Return air temperature range between 55°F (13°C) and 80°F (27°C) must be maintained.
- Air filters must be replaced and pre-filter must be removed upon construction completion.
- The unit components, duct system, air filters and evaporator coil must be thoroughly cleaned following final construction clean-up.
- The unit operating conditions (including airflow, cooling operation, and heating operation) must be verified according to these installation instructions.

## **⚠ WARNING**

**Electric shock hazard and danger of explosion. Can cause injury, death or product or property damage. Turn off electrical power to unit before performing any maintenance or servicing operations on the unit.**

## **⚠ IMPORTANT**

**The Clean Air Act of 1990 bans the intentional venting of refrigerant (CFC's and HCFC's) as of July 1, 1992. Approved methods of recovery, recycling or reclaiming must be followed. Fines and/or incarceration may be levied for non-compliance.**

### **Unit Support**

**NOTE - Securely fasten roof frame to roof per local codes.**

## **⚠ CAUTION**

**To reduce the likelihood of supply / return air bypass and promote a proper seal with the RTU, duct work / duct drops / diffuser assemblies must be supported independently to the building structure.**

### **A - Downflow Discharge Application**

#### **Roof Mounting with C1CURB**

- 1- The C1CURB roof mounting frame must be installed, flashed and sealed in accordance with the instructions provided with the frame.

- 2- The C1CURB roof mounting frame should be square and level to 1/16" per linear foot (5mm per linear meter) in any direction.
- 3- Duct must be attached to the roof mounting frame and not to the unit; supply and return plenums must be installed before setting the unit.

#### **Installer's Roof Mounting Frame**

Many types of roof frames can be used to install the unit, depending upon different roof structures. Items to keep in mind when using the building frame or supports are:

- 1- The unit base is fully enclosed and insulated, so an enclosed frame is not required.
- 2- The frames or supports must be constructed with non-combustible materials and should be square and level to 1/16" per linear foot (5mm per linear meter) in any direction.
- 3- Frame or supports must be high enough to prevent any form of moisture from entering unit. Recommended minimum frame height is 14" (356mm).
- 4- Duct must be attached to the roof mounting frame and not to the unit. Supply and return plenums must be installed before setting the unit.
- 5- Units require support along all four sides of unit base. Supports must be constructed of steel or suitably treated wood materials.

*NOTE-When installing unit on a combustible surface for downflow discharge applications, the C1CURB roof mounting frame is required.*

#### **B - Horizontal Discharge Applications**

- 1- Units which are equipped with an optional economizer and installed in horizontal airflow applications must use a horizontal conversion kit.
- 2- Specified installation clearances must be maintained when installing units. Refer to figure 1.
- 3- Top of support slab should be at least 4" (102mm) above the finished grade and located so no run-off water from higher ground can collect around the unit.
- 4- Units require support along all four sides of unit base. Supports must be constructed of steel or suitably treated wood materials.

## Duct Connection

All exterior ducts, joints, and openings in roof or building walls must be insulated and weatherproofed with flashing and sealing compounds in accordance with applicable codes. Any duct passing through an unconditioned space must be insulated.

## ! CAUTION

In downflow applications, do not drill or punch holes in base of unit. Leaking in roof may occur if unit base is punctured.

## Rigging Unit For Lifting

- 1- Detach wooden base protection before rigging.
- 2- Remove all six base protection brackets before setting unit.
- 3- Connect rigging to the unit base using both holes in each corner. See figure 2.
- 4- All panels must be in place for rigging.
- 5- Place field-provided H-style pick in place just above top edge of unit. Frame must be of adequate strength and length. (H-style pick prevents damage to unit.)

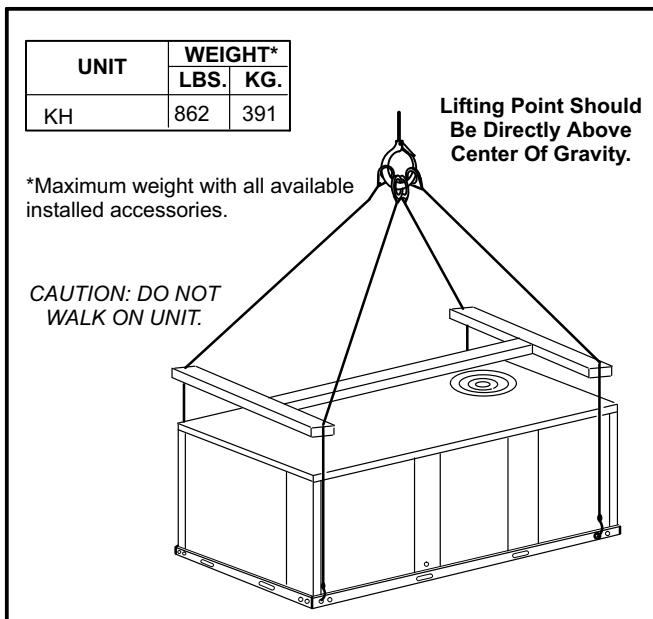

FIGURE 2

## Horizontal Air Discharge

Unit is shipped with panels covering the horizontal supply and return air openings. Remove horizontal covers and place over downflow openings for horizontal air discharge. See figure 3. Secure in place with sheet metal screws.

## UNIT SUPPLY AND RETURN AIR OPENINGS

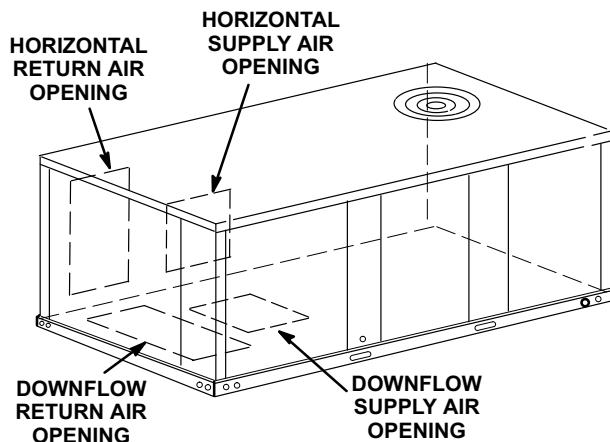

FIGURE 3

### Units Equipped With An Optional Economizer -

- 1- Remove the horizontal supply air cover and position over the downflow supply air opening. Secure with sheet metal screws.
- 2- Leave the horizontal return air cover in place.
- 3- Locate the separately ordered horizontal air discharge kit. Place the kit panel over the downflow return air opening.
- 4- Remove and retain the barometric relief dampers and lower hood.
- 5- Install return air duct beneath outdoor air intake. See figure 4. Install barometric relief damper in lower hood and install in duct as shown in figure 4.

## HORIZONTAL RETURN AIR DUCTWORK WITH ECONOMIZER

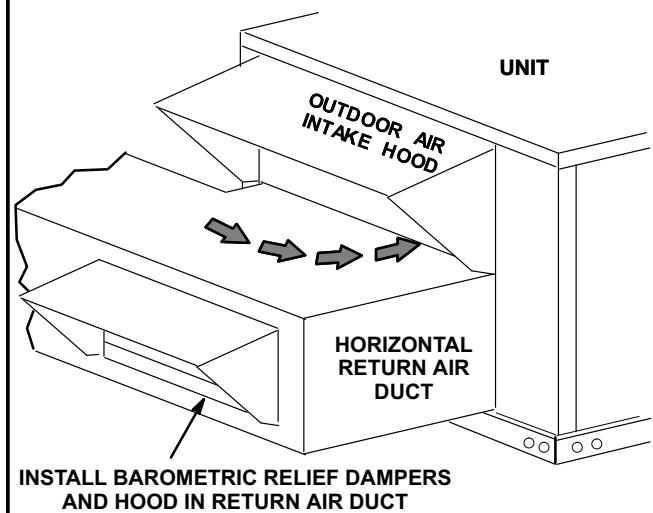

FIGURE 4

## Condensate Drains

Make drain connection to the 1" N.P.T. drain coupling provided on unit.

*Note - The drain pan is made with a glass reinforced engineered plastic capable of withstanding typical joint torque but can be damaged with excessive force. Tighten pipe nipple hand tight and turn an additional quarter turn.*

A trap must be installed between drain connection and an open vent for proper condensate removal. See figure 5 or 6. It is sometimes acceptable to drain condensate onto the roof or grade; however, a tee should be fitted to the trap to direct condensate downward. The condensate line must be vented. Check local codes concerning condensate disposal. Refer to pages 1 and 2 for condensate drain location.

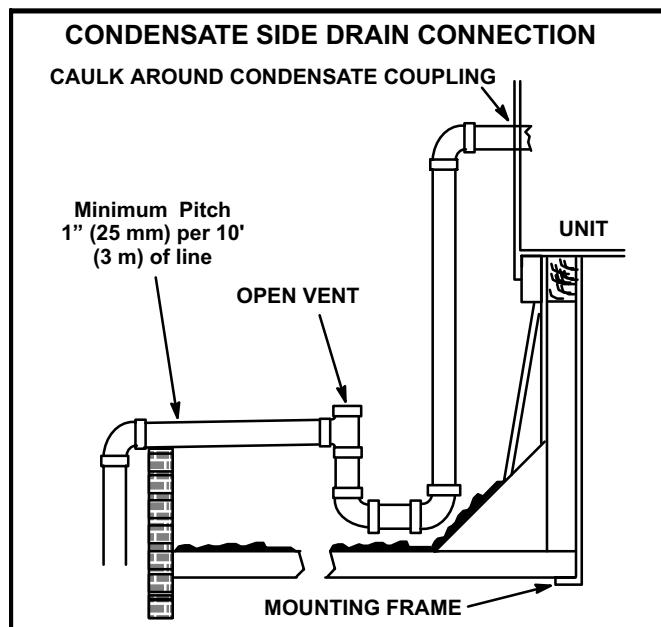

FIGURE 5

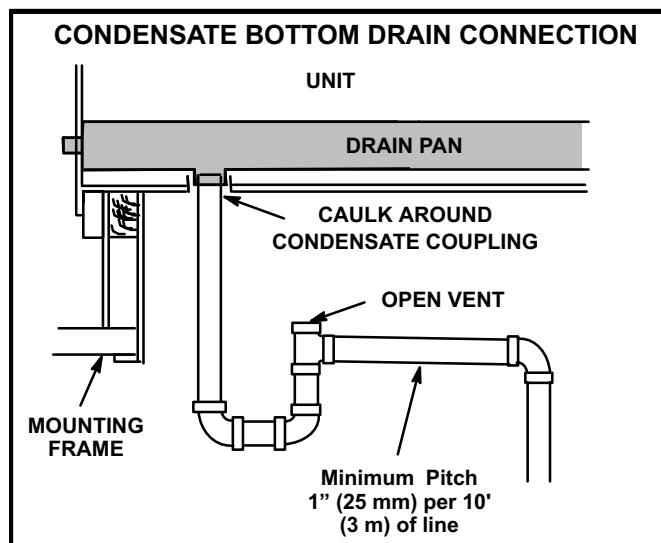

FIGURE 6

Units are shipped with the drain coupling facing the front of the unit. Condensate can be drained from the back or bottom of the unit with the following modifications. The unit can be installed in either downflow or horizontal air discharge regardless of condensate drain location.

### Rear Drain Connection

- 1- Remove the condensate drain mullion. See figure 7.  
Remove the two panels on each side of the mullion.

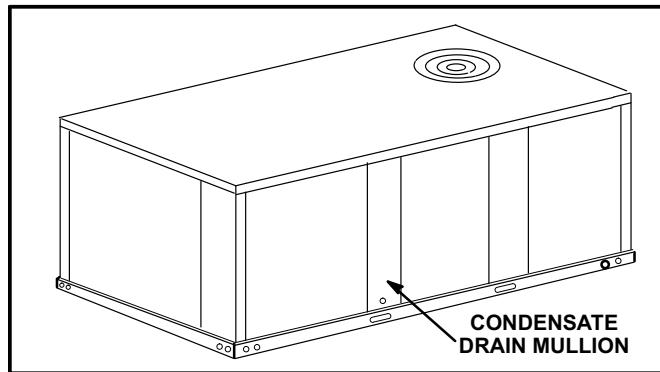

FIGURE 7

If the unit has hinged panels, two hinge screws must be removed in addition to the mullion screws. See figure 8.

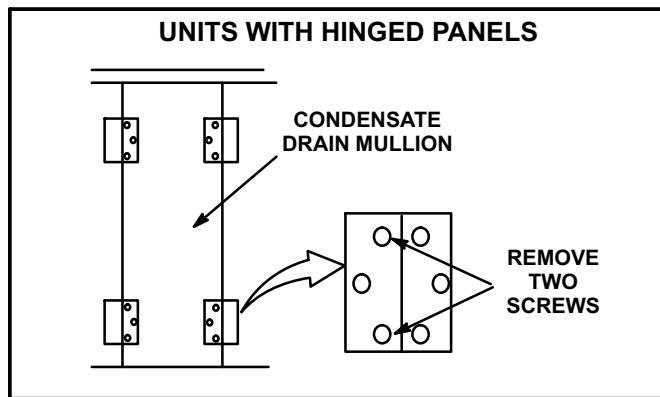

FIGURE 8

- 2- Lift the front edge of the drain pan and slide pan out of unit. See figure 9.

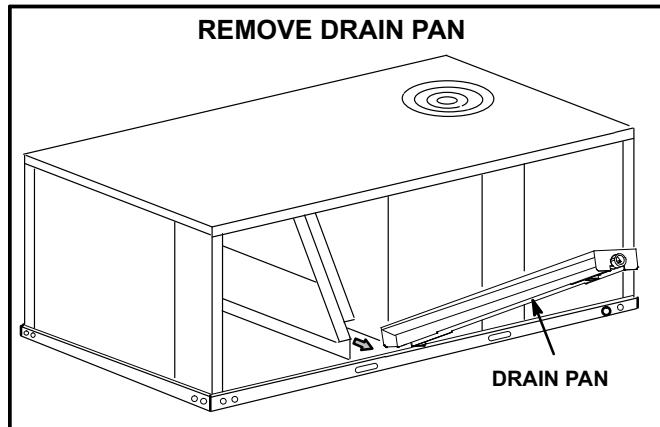

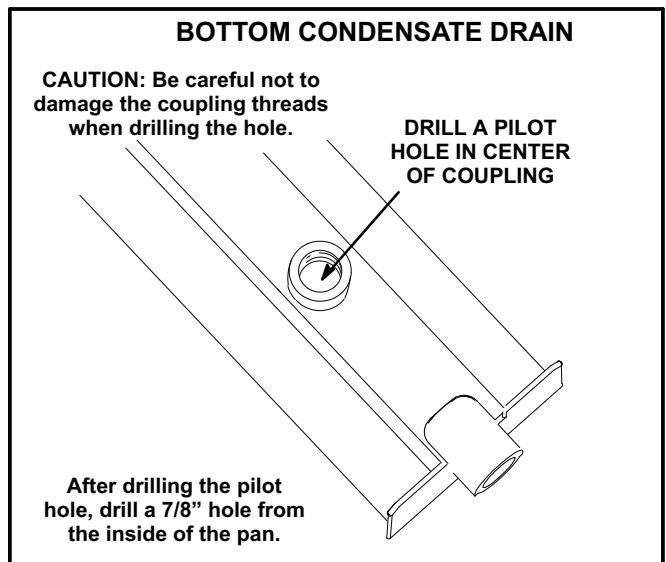

FIGURE 9

- 3- Make sure the cap over the unit bottom drain hole is secure.
- 4- Rotate the drain pan until the downward slope is toward the back of the unit. Slide the drain pan back into the unit. Be careful not to dislodge the cap over the bottom drain hole.
- 5- From the back side of the unit, pull the drain pan coupling through the rear condensate opening.
- 6- Replace the condensate drain mullion and reinstall screws. Reinstall access doors.
- 7- From the back side of the unit, pull the drain pan coupling through the rear condensate opening.
- 8- From the front side of the unit, move the drain pan until the bottom coupling settles into the unit bottom drain opening. Once in place, check to make sure the coupling is still positioned through the rear condensate drain hole.
- 9- Use a field-provided 1" plug to seal side drain connection.
- 10- Replace the condensate drain mullion and reinstall screws. Reinstall access doors.

### **Bottom Drain Connection**

- 1- Remove the condensate drain mullion. See figure 7. If the unit has hinged panels, two hinge screws must be removed in addition to the mullion screws. See figure 8.
- 2- Lift the front edge of the drain pan and slide pan out of unit. See figure 9.
- 3- Turn the drain pan upside down and drill a pilot hole through the bottom of the drain pan in the center of the coupling. See figure 10.
- 4- From the inside of the pan, use a Vari-Bit® bit to enlarge the hole to 7/8". Do not damage coupling threads.
- 5- Remove the cap over the unit bottom drain hole.
- 6- Slide the drain pan back into the unit.

- 7- From the back side of the unit, pull the drain pan coupling through the rear condensate opening.
- 8- From the front side of the unit, move the drain pan until the bottom coupling settles into the unit bottom drain opening. Once in place, check to make sure the coupling is still positioned through the rear condensate drain hole.
- 9- Use a field-provided 1" plug to seal side drain connection.
- 10- Replace the condensate drain mullion and reinstall screws. Reinstall access doors.

**FIGURE 10**

## Electrical Connections

### POWER SUPPLY

Do not apply power or close disconnect switch until installation is complete. Refer to start-up directions. Refer closely to unit wiring diagram.

Refer to unit nameplate for minimum circuit ampacity and maximum fuse size.

- 1- Units are factory-wired for 230,460,575 volt supply. **For 208V supply**, remove the insulated terminal cover from the 208V terminal on the control transformer. Move the wire from the transformer 240V terminal to the 208V terminal. Place the insulated terminal cover on the unused 240V terminal.
- 2- Route power through the bottom power entry area and connect to TB2 or factory-installed circuit breaker or disconnect. Secure power wiring with factory-installed wire ties provided in control box. See unit wiring diagram.

### CONTROL WIRING

#### A - Thermostat Location

Room thermostat mounts vertically on a standard 2" X 4" handy box or on any non-conductive flat surface.

Locate thermostat approximately 5 feet (1524 mm) above the floor in an area with good air circulation at average temperature. Avoid locating the room thermostat where it might be affected by:

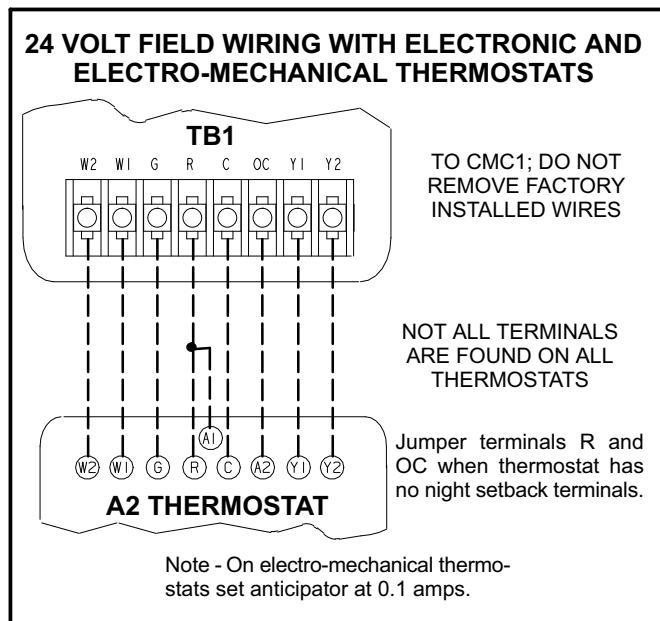

- drafts or dead spots behind doors and in corners
- hot or cold air from ducts
- radiant heat from sun or appliances
- concealed pipes and chimneys

**IMPORTANT - Unless field thermostat wires are rated for maximum unit voltage, they must be routed away from line voltage wiring. Use wire ties located near the lower left corner of the controls hat section to secure thermostat cable.**

#### B - Control Wiring

- 1- Route thermostat cable or wires from subbase to control area above compressor (refer to unit dimensions to locate bottom and side power entry). Use 18 AWG wire for all applications using remotely installed electro-mechanical and electronic thermostats.
- 2- Install thermostat assembly in accordance with instructions provided with thermostat.
- 3- Connect thermostat wiring to TB1 terminal control board on the lower side of the controls hat section. Wire as shown in figure 11 for electro-mechanical and electronic thermostats. If using other temperature control devices or energy management systems see instructions and wiring diagram provided by manufacturer.

*IMPORTANT-Terminal connections at the wall plate or subbase must be made securely. Loose control wire connections may allow unit to operate but not with proper response to room demand.*

**FIGURE 11**

## Blower Operation and Adjustments

Units are equipped with direct or belt drive blowers; available drive varies by model.

KHB high efficiency and KHB074 units are equipped with either two-stage belt drive blowers or direct drive, multi-tap motors. The blower will operate at high speed with a Y2 thermostat demand and low speed with a Y1 thermostat demand. Low speed operation delivers approximately  $\frac{2}{3}$  of the air volume of high speed. Two-speed blower operation results in lower energy consumption.

### ! IMPORTANT

Three phase scroll compressors must be phased sequentially for correct compressor and blower rotation. Follow "COOLING START-UP" section of installation instructions to ensure proper compressor and blower operation.

#### A - Blower Operation

- 1- Set thermostat or temperature control device fan switch to **AUTO** or **ON**. With fan switch in **ON** position, blower will operate continuously. With fan switch in **AUTO** position, the blower will cycle with demand.
- 2- Blower and entire unit will be off when thermostat or temperature control device system switch is in **OFF** position.

#### B - Determining Unit CFM - Direct Drive Blowers

- 1- The following measurements must be made with air filters in place.
- 2- With all access panels in place, measure static pressure external to unit (from supply to return). Add any additional air resistance for options and accessories shown on page 28.
- 3- Use figure 12 to determine the factory set blower speed(s) for standard efficiency units and figure 13 for high efficiency units.

4- Use page 13 through 19, the measured static pressure, and the factory-set blower speed to determine CFM.

#### 5- Standard Efficiency Units -

If CFM is lower than the design specified CFM, move the lead from speed tap 3 or 4 to speed tap 2. See figure 14. Refer to table 1 for minimum airflow when electric heat is installed.

*Note - For 460/575V units, remove the isolation lead from speed tap 2 before moving the wire to speed tap 2. Tape the exposed end of the isolation lead and secure away from other components.*

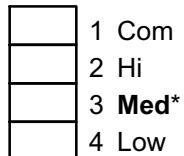

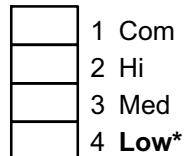

#### High Efficiency Units -

If low speed CFM is lower than the design specified CFM, move the lead marked *B3-Low* from the green wire to the white wire. See figure 13. If high speed CFM is lower than the design specified CFM, move the lead marked *B3-High* from the blue wire to the black (med. High) or brown (high) wire. Refer to table 1 for minimum airflow when electric heat is installed.

### BLOWER SPEED FACTORY SETTINGS (STD. EFFICIENCY UNITS)

036 Units

024, 030,  
048 Units

\*Factory Setting

FIGURE 12

### BLOWER SPEED FACTORY SETTINGS (HIGH EFFICIENCY UNITS)

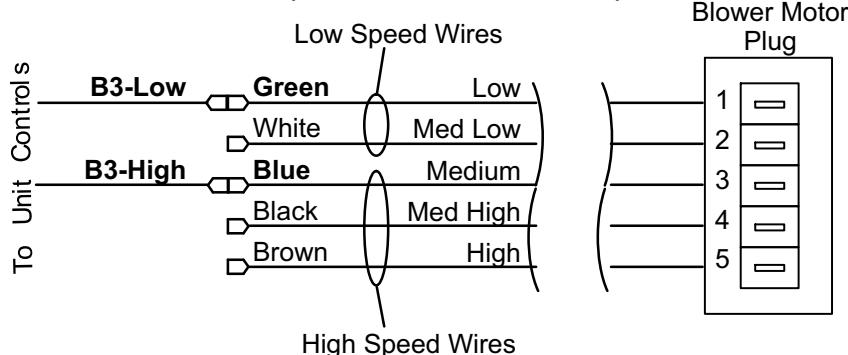

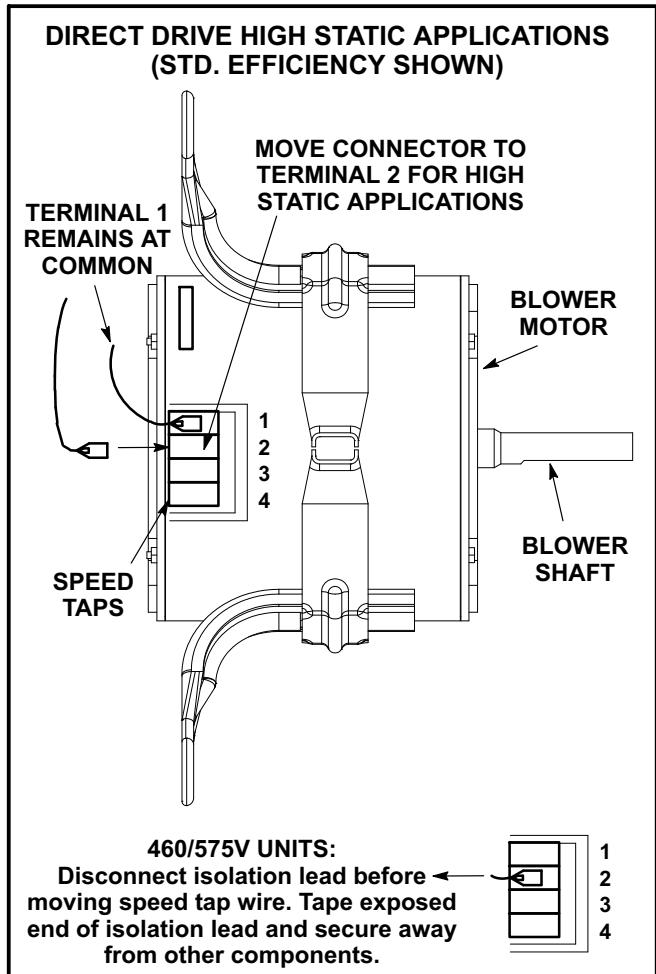

FIGURE 13

**FIGURE 14**

**TABLE 1  
MINIMUM AIRFLOW  
KH (BELT DRIVE) UNITS WITH ELECTRIC HEAT**

kW	CFM	
	Downflow	Horizontal
30	2250	2050
22.5	1750	1800
15	1250	1350
7.5	1050	1200

Direct drive units with electric heat (5.0-22.5kW) can operate on low speed up to 0.6" w.g. maximum static pressure.

#### C - Determining Unit CFM - Belt Drive Blowers

**IMPORTANT - KHB074 blower (G thermostat) **CFM MUST BE ADJUSTED IN HIGH SPEED**.** Disconnect factory-installed J350 low speed connector from P350. Connectors are located near the bottom of the control box. Connect J351 high speed connector to P350. Once blower CFM is set, J350 can be reconnected to operate the blower on low during ventilation only demands. See table 2.

**TABLE 2  
TWO-SPEED BLOWER OPERATION  
KHB074 UNITS**

Thermostat	Blower Speed
G (P350/J350)*	Low
G (P350/J351)	High
W1	High
W2	High
Y1	Low
Y2	High

\*Factory-installed jack/plug connection.

- 1- The following measurements must be made with air filters in place.
- 2- With all access panels in place, measure static pressure external to unit (from supply to return). Blower performance data is based on static pressure readings taken in locations shown in figure 15.

*Note - Static pressure readings can vary if not taken where shown.*

- 3- Measure the indoor blower wheel RPM.
- 4- Referring to pages 20 through 27, use static pressure and RPM readings to determine unit CFM. Use page 28 when installing units with any of the options or accessories listed. Refer to table 1 for minimum airflow when electric heat is installed.

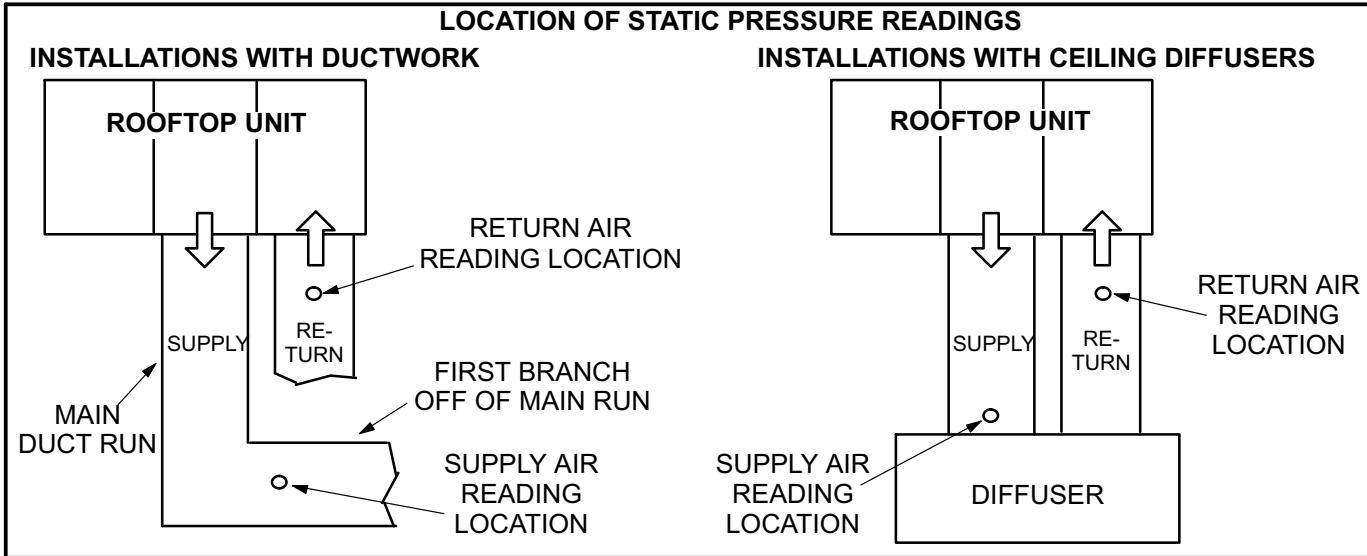

FIGURE 15

- 5- The blower RPM can be adjusted at the motor pulley. Loosen Allen screw and turn adjustable pulley clockwise to increase CFM. Turn counterclockwise to decrease CFM. See figure 17. Do not exceed minimum and maximum number of pulley turns as shown in table 3.

**TABLE 3**  
**MINIMUM AND MAXIMUM PULLEY ADJUSTMENT**

Belt	Min. Turns Open	Maxi. Turns Open
A Section	No minimum	5

- 6- *KHB074 Unit Only* - If low speed during ventilation is desired, replace J351 connector with J350.

#### D - Blower Belt Adjustment

Maximum life and wear can be obtained from belts only if proper pulley alignment and belt tension are maintained. Tension new belts after a 24-48 hour period of operation. This will allow belt to stretch and seat grooves. Make sure blower and motor pulley are aligned as shown in figure 16.

- 1- Loosen four bolts securing motor base to mounting frame. See figure 17.

- 2- *To increase belt tension* - Slide blower motor downward to tighten the belt. This increases the distance between the blower motor and the blower housing.  
*To loosen belt tension* - Slide blower motor upward to loosen the belt. This decreases the distance between the blower motor and the blower housing.
- 3- Tighten four bolts securing motor base to the mounting frame.

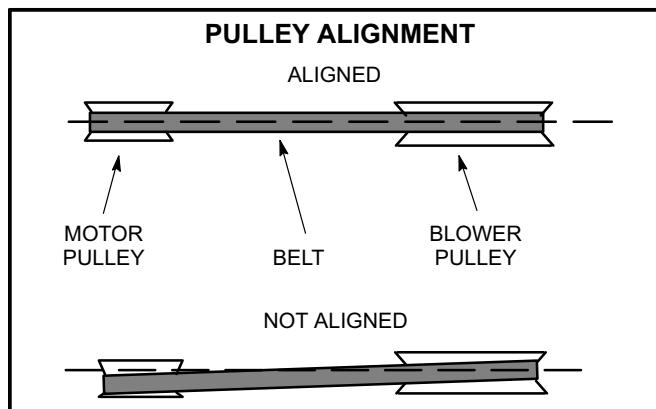

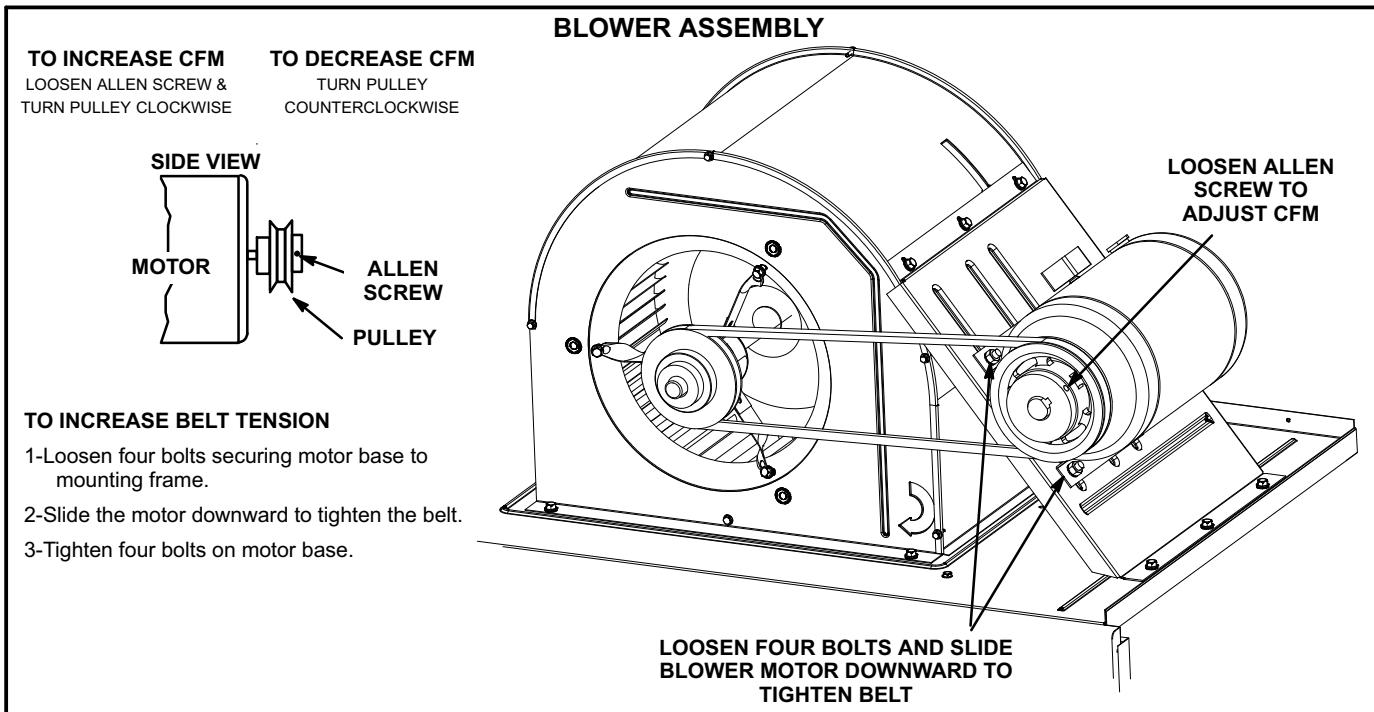

FIGURE 16

**FIGURE 17**

#### E - Check Belt Tension

Overtensioning belts shortens belt and bearing life. Check belt tension as follows:

- 1- Measure span length X. See figure 18.
- 2- Apply perpendicular force to center of span (X) with enough pressure to deflect belt  $1/64"$  for every inch of span length or  $1.5\text{mm}$  per  $100\text{mm}$  of span length.

Example: Deflection distance of a  $40"$  span would be  $40/64"$  or  $5/8"$ .

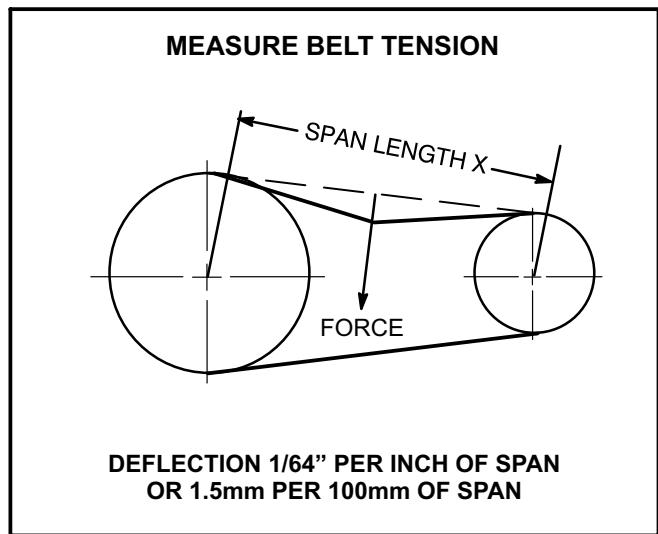

Example: Deflection distance of a  $400\text{mm}$  span would be  $6\text{mm}$ .

- 3- Measure belt deflection force. For a used belt, the deflection force should be 5 lbs. ( $35\text{kPa}$ ). A new belt deflection force should be 7 lbs. ( $48\text{kPa}$ ).

A force below these values indicates an undertensioned belt. A force above these values indicates an overtensioned belt.

#### F - Field-Furnished Blower Drives

For field-furnished blower drives, use page 20 through 27 to determine BHP and RPM required. Reference page 28 for drive kit specifications and table 4 for manufacturer's drive component numbers.

**FIGURE 18**

## BLOWER DATA - DIRECT DRIVE - KHB024-030 - STANDARD EFFICIENCY

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (economizer, wet coil, etc.) See page 29.

2 - Any field installed accessories air resistance (electric heat, duct resistance, diffuser, etc.) See page 29.

## BLOWER DATA - DIRECT DRIVE - KHB048 - STANDARD EFFICIENCY

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (economizer, wet coil, etc.) See page 29.

2 - Any field installed accessories air resistance (electric heat, duct resistance, diffuser, etc.) See page 29.

## BLOWER DATA - BELT DRIVE - DOWNTIME - KHA072, KHB074

BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (economizer, wet coil, etc.).

2 - Any field installed accessories air resistance (duct resistance, diffuser, etc.).

See page 29 for blower motors and drives and wet coil and options/accessory air resistance data.

NOTE - Using total air volume and system static pressure requirements determine from blower performance tables rpm and motor hp required. Maximum usable hp of motors furnished are shown. In Canada, nominal motor hp is also maximum usable motor hp. If motors of comparable hp are used, be sure to keep within the service factor limitations outlined on the motor nameplate.

## Start-Up

### !IMPORTANT

If unit is equipped with a crankcase heater. Make sure heater is energized 24 hours before unit start-up to prevent compressor damage as a result of slugging.

## A-Start-Up

### Heating

- 1- Set thermostat or temperature control device to initiate a first-stage heating demand.
- 2- A first-stage heating demand (W1) will energize compressors 1 and the outdoor fan.

*Note - L1 reversing valve is de-energized in the heating mode.*

#### *KH Units With Optional Electric Heat -*

An increased heating demand (W2) will energize electric heat. Electric heat is also energized during the defrost cycle (W1) to maintain discharge air temperature.

### Cooling

- 1- Initiate first and second stage cooling demands according to instructions provided with thermostat. See table 5 for operation.

*Note - KHB024H, 036H, 048H, 060H & 074S units are equipped with two-stage compressors.*

**TABLE 5**  
**COOLING OPERATION**

T'Stat Demand	Energized	
<b>024-072S No Economizer or Outdoor Air Unsuitable</b>		
Y1	Compressor	OD Fan

<b>074S, 024-060H Unit Equipped With An Economizer</b>		
Y1	Economizer	na
Y2	Economizer + Compressor Low Speed <sup>1</sup>	OD Fan Low Sp. <sup>3</sup>

<sup>1</sup>67% of full capacity

<sup>2</sup>100% of full capacity

<sup>3</sup>074S outdoor fans are single-speed

*Note - The reversing valve is energized at the same time as the compressor.*

- 2- Units contain one refrigerant circuit or stage.
- 3- Unit is charged with R-410A refrigerant. See unit rating plate for correct amount of charge.
- 4- Refer to Refrigerant Charge and Check section for proper method to check refrigerant charge.

## B-Three Phase Scroll Compressor Voltage Phasing

Three phase scroll compressors must be phased sequentially to ensure correct compressor and blower rotation and operation. Compressor and blower are wired in phase at the factory. Power wires are color-coded as follows: line 1-red, line 2-yellow, line 3-blue.

- 1- Observe suction and discharge pressures and blower rotation on unit start-up.
- 2- Suction pressure must drop, discharge pressure must rise, and blower rotation must match rotation marking.

If pressure differential is not observed or blower rotation is not correct:

- 3- Disconnect all remote electrical power supplies.
- 4- Reverse any two field-installed wires connected to the line side of K1 contactor. Do not reverse wires at blower contactor.

Make sure the connections are tight.

Discharge and suction pressures should operate at their normal start-up ranges.

## C - Refrigerant Charge and Check - KHA072 & KHB074S

**WARNING**-Do not exceed nameplate charge under any condition.

This unit is factory charged and should require no further adjustment. If the system requires charge, **reclaim the charge, evacuate the system, and add required nameplate charge.**

*NOTE - System charging is not recommended below 60°F (15°C). In temperatures below 60°F (15°C) , the charge must be weighed into the system.*

If weighing facilities are not available, or to check the charge, use the following procedure:

- 1- Attach gauge manifolds and operate unit in cooling mode until system stabilizes (approximately five minutes).
- 2- Check each system separately with all stages operating.
- 3- Use a thermometer to accurately measure the outdoor ambient temperature.
- 4- Apply the outdoor temperature to table 6 or 7 to determine normal operating pressures.
- 5- Compare the normal operating pressures to the pressures obtained from the gauges. Minor variations in these pressures may be expected due to differences in installations. Significant differences could mean that the system is not properly charged or that a problem exists with some component in the system. **Correct any system problems before proceeding.**

**TABLE 6  
KHA072S NORMAL OPERATING PRESSURES**

Outdoor Coil Entering Air Temp	Dis. $\pm$ 10 psig	Suct. $\pm$ 5 psig
65°F	257	134
75°F	297	138
85°F	340	142
95°F	387	146
105°F	438	149
115°F	493	153

**TABLE 7  
KHB074S NORMAL OPERATING PRESSURES**

Outdoor Coil Entering Air Temp	Dis. $\pm$ 10 psig	Suct. $\pm$ 5 psig
65°F	257	127
75°F	297	134
85°F	340	139
95°F	386	142
105°F	438	146
115°F	491	149

6- If discharge pressure is high, remove refrigerant from the system. If discharge pressure is low, add refrigerant to the system.

- Add or remove charge in increments.
- Allow the system to stabilize each time refrigerant is added or removed.

7- Use the following approach method along with the normal operating pressures to confirm readings.

## D - Charge Verification - Approach Method - KHA072S & KHB074S

1- Using the same thermometer, compare liquid temperature to outdoor ambient temperature.

Approach Temperature = Liquid temperature minus ambient temperature.

2- Approach temperature should match values in table 8. An approach temperature greater than value shown indicates an undercharge. An approach temperature less than value shown indicates an overcharge.

3- Do not use the approach method if system pressures do not match pressures in table 6 or 7. The approach method is not valid for grossly over or undercharged systems.

**TABLE 8  
APPROACH TEMPERATURE**

Unit	Liquid Temp. Minus Ambient Temp.
KHA072S, KHB074S	8°F $\pm$ 1 (4.4°C $\pm$ 0.5)

## E-Refrigerant Charge and Check - KHB024-060

### WARNING-Do not exceed nameplate charge under any condition.

This unit is factory charged and should require no further adjustment. If the system requires additional refrigerant, reclaim the charge, evacuate the system, and add required nameplate charge.

*NOTE - System charging is not recommended below 60°F (15°C). In temperatures below 60°F (15°C), the charge must be weighed into the system.*

If weighing facilities are not available, or to check the charge, use the following procedure:

#### IMPORTANT - Charge unit in standard cooling mode.

- 1- Make sure outdoor coil is clean. Attach gauge manifolds and operate unit at full CFM in cooling mode with economizer disabled until system stabilizes (approximately five minutes). Make sure all outdoor air dampers are closed.
- 2- Compare the normal operating pressures (see table 9 through 16) to the pressures obtained from the gauges. Check unit components if there are significant differences.
- 3- Measure the outdoor ambient temperature and the suction pressure. Refer to the appropriate circuit

charging curve to determine a target liquid temperature.

*Note - Pressures are listed for sea level applications.*

- 4- Use the same thermometer to accurately measure the liquid temperature (in the outdoor section).
  - If measured liquid temperature is higher than the target liquid temperature, add refrigerant to the system.
  - If measured liquid temperature is lower than the target liquid temperature, recover some refrigerant from the system.
- 5- Add or remove charge in increments. Allow the system to stabilize each time refrigerant is added or removed.
- 6- Continue the process until measured liquid temperature agrees with the target liquid temperature. Do not go below the target liquid temperature when adjusting charge. Note that suction pressure can change as charge is adjusted.
- 7- Example KHB024: At 95°F outdoor ambient and a measured suction pressure of 130psig, the target liquid temperature is 101°F. For a measured liquid temperature of 112°F, add charge in increments until measured liquid temperature agrees with the target liquid temperature.

## F - Compressor Controls

See unit wiring diagram to determine which controls are used in each unit. Optional controls are identified on wiring diagrams by arrows at junction points.

### 1- Freezestat (S49)

Switch de-energizes compressor when indoor coil temperature falls below 29°F (-2°C) to prevent coil freeze-up. Switch resets when indoor coil temperature reaches 58°F (15°C).

### 2- High Pressure Switch (S4)

Auto-reset switch is located on the discharge line. Switch opens at 640 psig and closes at 475 psig. Switch is wired directly into the defrost control (CMC1), which provides a 5 strike lockout feature.

### 3- Defrost Switch (S6)

*100269 Series Only*

Defrost switch closes to initiate defrost when liquid line temperature falls to 42°F (5.6°C). Defrost switch opens when liquid line temperature reaches 70°F (21°C) to terminate defrost. If the liquid line temperature does not rise above 70°F (21°C), the CMC1 will terminate defrost after 14 minutes. The defrost switch is located on the liquid line between the outdoor expansion valve and the distributor

### 4- Ambient and Coil Temperature Sensors (RT13, RT21)

*100135 Series Only*

Both sensors provide input to the defrost control which cycles defrost. The ambient sensor is located on the inside of the corner mullion on the back of the outdoor coil section. The coil sensor is located on a return bend on the front of the outdoor coil.

### 5- Defrost Controls (CMC1)

Electric heat is energized during defrost to maintain discharge air temperature.

#### *100269 Series Time/Temperature*

When the liquid line temperature drops below 42°F (5.6°C), the defrost switch closes and signals the defrost control that a defrost cycle is needed. If the defrost switch is still closed after 90 minutes (default), a defrost cycle begins and operates for 14 minutes. The defrost switch can terminate the defrost cycle before the 14 minutes elapses if liquid line temperature reaches 70°F (21°C).

*Note - The defrost control will not energize a defrost cycle unless the unit has been operating in heating mode for an accumulated 90 minutes (default) on 100269 series boards. The run time interval can be changed by moving the jumper on the CMC board timing pins. See figure 19. The defrost interval can be adjusted to 30, 60, or 90 minutes. If the timing selector jumper is not in place, the control defaults to a 90-minute defrost interval.*

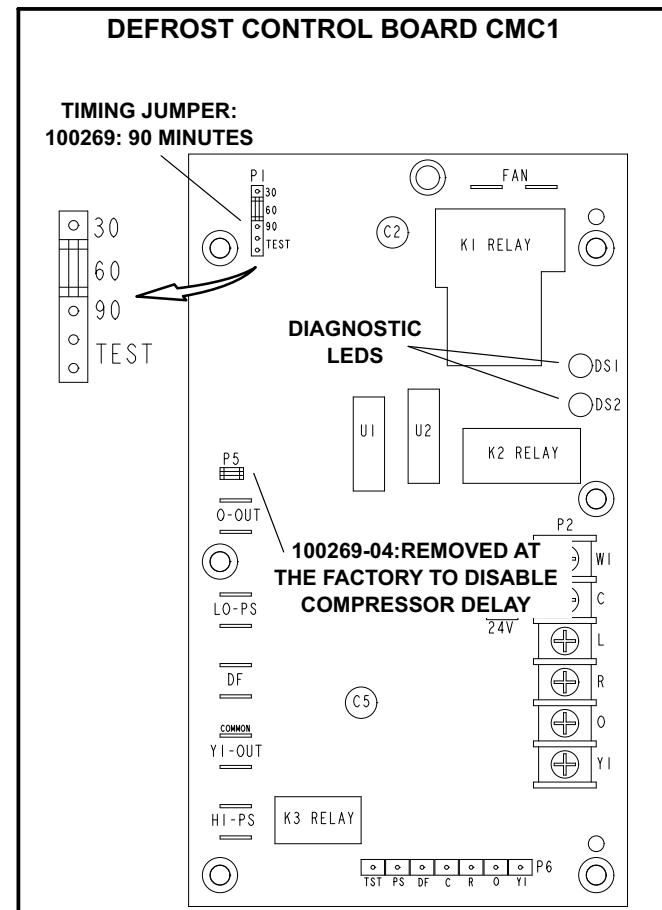

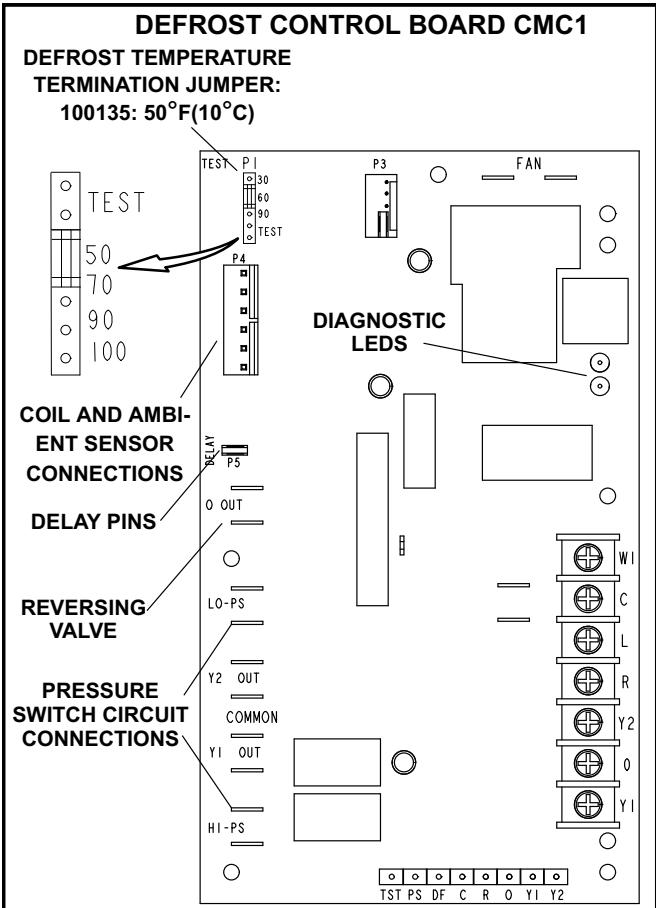

FIGURE 19

### 5- Defrost Controls (CMC1) - Continued

#### *100135 Series Demand Defrost Control*

After 34 minutes of heating mode operation, if the difference between the ambient temperature (RT13) and the coil temperature (RT21) is higher than the maximum difference allowed by the control, the defrost control will initiate defrost. The defrost control will also initiate defrost after 6 hours of heating mode operation when coil temperatures remain below 35°F (2°C). The defrost cycle ends when the coil temperature is higher than the termination temperature (50°F default) or after 14 minutes of operation. If the defrost is terminated by the 14-minute timer, another defrost cycle will be initiated after 34 minutes of run time.

*Note - The defrost termination temperature can be adjusted to 50, 70, 90 or 100°F. The jumper termination pin is factory-set at 50°F (10°C). If the temperature jumper is not installed, the default termination temperature is 90°F (32°C). See figure 20.*

**FIGURE 20**

### Defrost Control Board

The defrost control ensures that the heat pump outdoor coil does not ice excessively during the heating mode. The defrost control uses input from a defrost switch on 100269 series defrost control boards. The defrost control uses input from a coil and an ambient temperature sensor on 100135 series defrost control boards.

#### Defrost Test Option

A TEST option is provided for troubleshooting. The TEST mode may be started any time the unit is in the heating mode and the defrost thermostat is closed or jumpered. If the timing jumper is in the TEST position at power-up, the defrost control will ignore the test pins. When the jumper is placed across the TEST pins for two seconds, the control will enter the defrost mode. If the jumper is removed before an additional 5-second period has elapsed (7 seconds total), the unit will remain in defrost mode until the defrost pressure switch opens or 14 minutes have passed. If the jumper is not removed until after the additional 5-second period has elapsed, the defrost will terminate and the test option will not function again until the jumper is removed and re-applied.

#### Diagnostic LEDs

The defrost board uses two LEDs for diagnostics. The LEDs flash a sequence according to the condition.

**TABLE 18**

Defrost Control Board Diagnostic LED		
Mode	Green LED (DS2)	Red LED (DS1)
No power to control	OFF	OFF
Normal operation / power to control	Simultaneous Slow FLASH	
Anti-short cycle lockout	Alternating Slow FLASH	
Low pressure switch, freezestat fault	OFF	Slow FLASH
Low pressure switch, freezestat lockout	OFF	ON
High pressure switch fault	Slow FLASH	OFF
High pressure switch lockout	ON	OFF
*Ambient sensor fault	Simultaneous FAST flash	
*Coil sensor fault	Alternating FAST flash	

\*100135 board only

### Service

The unit should be inspected once a year by a qualified service technician.

## ⚠ CAUTION

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

#### A - Lubrication

All motors are lubricated at the factory. No further lubrication is required.

#### B - Supply Air Blower Wheel

Annually inspect supply air blower wheel for accumulated dirt or dust. Turn off power before attempting to remove access panel or to clean blower wheel.

#### C - Filters

Units are equipped with temporary filters which need to be replaced before the building is occupied. See table 19 for correct filter size. Refer to local codes or appropriate jurisdiction for approved filters.

Approved filters should be checked monthly and replaced when necessary. Take note of air flow direction marking on filter frame when reinstalling filters. See figure 21.

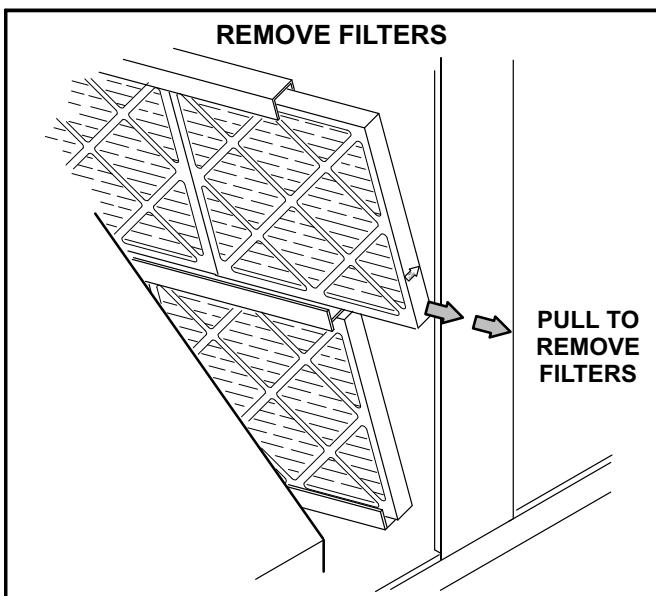

## ⚠️ WARNING

**Units are shipped from the factory with temporary filters. Replace filters before building is occupied. Damage to unit could result if filters are not replaced with approved filters. Refer to appropriate codes.**

**TABLE 19  
UNIT FILTERS**

Unit	Qty	Filter Size - inches (mm)
KHB024, 030, 036	4	16 X 20 X 2 (406 X 508 X 51)
KHA072 KHB048, 060, 074	4	20 X 20 X 2 (508 X 508 X 51)

**NOTE** - Filters must be U.L.C. certified or equivalent for use in Canada.

**FIGURE 21**

### **D - Indoor Coil**

Inspect and clean coil at beginning of each cooling and heating season. Clean using mild detergent or commercial coil cleanser. Flush coil and condensate drain with water taking care not to get insulation, filters and return air ducts wet.

### **E - Filter Drier**

The unit is equipped with a bi-flow filter drier. If replacement is necessary, order another of like design.

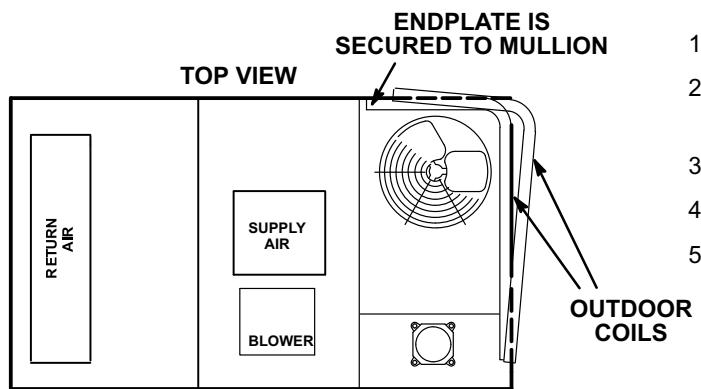

### **F - Outdoor Coil**

Clean outdoor coil annually with detergent or commercial coil cleaner and inspect monthly during the cooling season.

Outdoor coils are made of single and two formed slabs. On units with two slabs, dirt and debris may become trapped between the slabs. To clean between slabs, carefully separate coil slabs and wash them thoroughly. See figure 22. Flush coils with water following cleaning.

*Note - Remove all screws and gaskets prior to cleaning procedure and replace upon completion.*

### **CLEAN OUTDOOR COIL**

- 1- Remove screws securing coil end plate to mullion.
- 2- Remove wire ties connecting coil slabs and separate slabs 3-4" (76-102mm).
- 3- Clean coils with detergent or commercial coil cleaner.
- 4- Rinse thoroughly with water and reassemble.
- 5- Secure coil slabs together using field-provided wire ties.

**FIGURE 22**
