**WARNING**

Improper installation, adjustment, alteration, service or maintenance can cause personal injury, loss of life, or damage to property. Installation and service must be performed by a licensed professional installer (or equivalent), service agency or the gas supplier.

---

**WARNING**

FIRE OR EXPLOSION HAZARD.

Failure to follow safety warnings exactly could result in serious injury, death, or property damage.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

Installation and service must be performed by a qualified installer, service agency or the gas supplier.

**WHAT TO DO IF YOU SMELL GAS:**

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Leave the building immediately.
- Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

Page 2
Shipping & Packing List

1 - Assembled gas package unit
1 - Vent hood assembly with screen and screws

As soon as the unit is received, it should be inspected for possible damage during transit. If you find any damage, immediately contact the last carrier.

General

These installation instructions are intended as a general guide only, for use by an experienced, qualified contractor. The 13GCSX units are single-package air conditioners designed for outdoor installation on a rooftop or a slab. The unit must be sized based on heat loss and heat gain calculations made according to the methods of the Air Conditioning Contractors of America (ACCA).

The units are shipped assembled. All piping, refrigerant charge, and electrical wiring are factory-installed and tested. The units require electric power, gas piping, condensate drain and duct connections at the point of installation. In addition, the heating vent hood must be installed before the unit is placed into operation.

Safety Information

CAUTION
As with any mechanical equipment, personal injury can result from contact with sharp sheet metal edges. Be careful when you handle this equipment.

IMPORTANT
This unit is charged with HFC-410A refrigerant. Operating pressures for units charged with HFC-410A are higher than pressures in units charged with HCFC-22. All service equipment MUST be rated for use with HFC-410A refrigerant.

These units must be installed in accordance with all applicable national and local safety codes. These instructions are intended as a general guide and do not supersede local codes in any way. Consult authorities having jurisdiction before installation.

If components are to be added to a unit to meet local codes, they are to be installed at the dealer’s and/or customer’s expense.
WARNING

Product contains fiberglass wool. Disturbing the insulation in this product during installation, maintenance, or repair will expose you to fiberglass wool dust. Breathing this may cause lung cancer. (Fiberglass wool is known to the State of California to cause cancer.) Fiberglass wool may also cause respiratory, skin, and eye irritation.

To reduce exposure to this substance or for further information, consult material safety data sheets available from address shown below, or contact your supervisor.

Lennox Industries Inc.
P.O. Box 799900
Dallas, TX 75379-9900

These units are design listed by UL in both the United States and Canada as follows:

- For use as a forced air furnace with cooling.
- For outdoor installation only.
- For installation on combustible material.
- For use with natural gas or L.P./propane gas only. Use of L.P./propane gas requires installation of an L.P. conversion kit, which must be ordered separately.

These units are not suitable for use with conventional venting systems.

The following safety requirements must also be met when the 13GCSX units are installed:

1 - Use only with the type of fuel approved for use with this appliance. Refer to the unit rating plate.
2 - Position, locate and install the 13GCSX unit only as outlined in these instructions.
3 - Provide adequate clearance around the vent hood as specified in these instructions.
4 - Do not use an open flame to check for gas leaks. Use a commercially available soap solution, which has been designed specifically to check for gas leaks. Refer to the Gas Supply and Piping section.
5 - Check the unit operation after start-up to make sure that the 13GCSX is operating within the intended temperature rise range. The duct system must be designed to provide an external static pressure within the allowable range. Refer to the unit rating plate.

Lennox does not recommend the use of 13GCSX units as a construction heater during any phase of construction. Very low return air temperatures, harmful vapors and operation of the unit with clogged or misplaced filters will damage the unit.

13GCSX units may be used for heating of buildings or structures under construction, if the following conditions are met:

- The vent hood must be installed per these installation instructions.
- A room thermostat must control the unit. The use of fixed jumpers that will provide continuous heating is not allowed.
- The return air duct must be provided and sealed to the unit.
- Return air temperature range between 60°F (16°C) and 80°F (27°C) must be maintained.
- Air filters must be installed in the system and must be maintained during construction.
- Air filters must be replaced upon construction completion.
- The input rate and temperature rise must be set per the unit rating plate.
- One hundred percent (100%) outdoor air must be provided for combustion air requirements during construction. Installation of this unit in its intended outdoor location will accomplish this.
- The heat exchanger, components, duct system, air filters and evaporator coil must be thoroughly cleaned following final construction clean-up.
- The unit operating conditions (including ignition, input rate, temperature rise and venting) must be verified according to these installation instructions.

NOTE - The Commonwealth of Massachusetts stipulates these additional requirements:

- Gas furnaces shall be installed by a licensed plumber or gas fitter only.
- The gas cock must be “T handle” type.
- When flexible connectors are used, the maximum length shall not exceed 36”.

Location Selection

Use the following guidelines to select a suitable location for these units.

1 - Unit is designed for outdoor installation only. Unit must be installed so all electrical components are protected from water.
2 - Condenser coils must have an unlimited supply of air.
3 - For ground level installation, use a level pre-fabricated pad or use a level concrete slab with a minimum thickness of 4 inches. The length and width should be at least 6 inches greater than the unit base. Do not tie the slab to the building foundation.
4 - Maintain level within a tolerance of 1/4 inch maximum across the entire length or width of the unit.
5 - Do not locate the unit where the combustion air supply will be exposed to any corrosive substance, including the following:
Permanent wave solutions,
Chlorinated waxes or cleaners,
Chlorine-based swimming pool chemicals,
Water-softening chemicals,
De-icing salts or chemicals,
Carbon tetrachloride,
Halogen-type refrigerants,
Cleaning solvents (e.g., perchloroethylene),
Printing inks, paint removers, varnishes, etc.,
Cements and glues,
Anti-static fabric softeners used in clothes dryers,
Masonry acid-washing materials,
Chlorinated laundry products,
Hydrochloric acid.

**Rigging & Setting Unit**

Exercise care when moving the unit. Do not remove any packaging until the unit is near the place of installation. An optional lifting lug kit (92M51) may be purchased separately for use in rigging the unit for lifting. Spreaders whose length exceeds the largest dimension across the unit MUST be used across the top of the unit.

**CAUTION**

Before lifting a unit, make sure that the weight is distributed equally on the cables so that it will lift evenly.

Units may also be moved or lifted with a forklift while still in the factory supplied packaging.

*NOTE - Length of forks must be a minimum of 42 inches.*

**Clearances**

All units require certain clearances for proper operation and service. Refer to figure 2 for the clearances required for combustible construction, servicing, and proper unit operation.

*NOTE - Do not permit overhanging structures or shrubs to obstruct condenser air discharge outlet or vent outlet.*

**Service Clearances - Inches (Millimeters)**

<table>
<thead>
<tr>
<th>Top Clearance</th>
<th>36 in. (914 mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entire perimeter of unit base</td>
<td>requires support when elevated above mounting surface.</td>
</tr>
</tbody>
</table>

**Figure 1**

Accessory Lift Kit

**Figure 2**

In the U.S. units may be installed on combustible floors made from wood or class A, B, or C roof covering material. In Canada, units may be installed on combustible floors. The products of combustion are discharged through a screened vent outlet in the front mullion. Install the unit so that the products of combustion will not damage the outer building structure. The vent outlet must be at least 4 feet below, 4 feet horizontally from and 1 foot above any door, window or gravity air inlet into the building. In addition, install the unit so that the vent outlet is at least 3 feet above any forced air inlet located within 10 feet.

Clearances to the vent outlet must also be consistent with the requirements of the current National Fuel Gas Code (Z223.1) and/or the standards of the current CSA B149 codes.

Figure 3 shows the minimum clearances to combustibles required above and below the vent hood. The minimum clearance in front of the vent hood is 24 inches.

Install the unit so that snow accumulation will not restrict the flow of the flue products. Allow a required minimum horizontal clearance of 4 feet from electric meters, gas meters, regulators and relief equipment. In addition to the above requirements, ensure that unwanted ice caused by condensate is not allowed to accumulate around the unit. Do not locate the unit on the side of the building where the...
prevailing winter winds could trap moisture, causing it to freeze on the walls or on overhangs (under eaves). The vent outlet should not discharge flue products on a sidewalk, patio or other walkway where the condensate could cause the surface to become slippery. Do not install the unit so that the products of combustion will be allowed to accumulate within a confined space and recirculate.

The vent hood must be installed prior to unit start-up.

**Existing Common Vent Systems**

The 13GCSX packaged unit may replace an existing furnace which is being removed from a venting system commonly run with separate gas appliances. In this case, the existing vent system is likely to be too large to properly vent the remaining attached appliances.

Conduct the following test while each appliance is operating and the other appliances (which are not operating) remain connected to the common venting system. If the venting system has been installed improperly, you **must** correct the system as indicated in the general venting requirements section.

1. Seal any unused openings in the common venting system.
2. Inspect the venting system for proper size and horizontal pitch. Determine that there is no blockage, restriction, leakage, corrosion, or other deficiencies which could cause an unsafe condition.
3. Close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliances not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.
4. Follow the lighting instructions. Turn on the appliance that is being inspected. Adjust the thermostat so that the appliance operates continuously.
5. After the main burner has operated for 5 minutes, test for leaks of flue gases at the draft hood relief opening. Use the flame of a match or candle, or smoke from a cigarette, cigar, or pipe.
6. After determining that each appliance connected to the common venting system is venting properly, (step 3) return all doors, widows, exhaust fans, fireplace dampers, and any other gas-burning appliances to their previous mode of operation.
7. If a venting problem is found during any of the preceding tests, the common venting system must be modified to correct the problem.

Resize the common venting system to the minimum vent pipe size determined by using the appropriate tables in Appendix G. (These are in the current standards of the National Fuel Gas Code...
ANSI-Z223.1/NFPA 54 in the USA, and the appropriate Category 1 Natural Gas and Propane appliances venting sizing tables in the current standards of the CSA B149 Natural Gas and Propane Installation Codes in Canada.)
Condensate Drain

The 13GCSX unit is equipped with a 3/4 inch FPT coupling for condensate line connection. Plumbing must conform to local codes. Use a sealing compound on male pipe threads.

The drain line must be properly trapped and routed to a suitable drain. See figure 5 for proper drain arrangement. The drain line must pitch to an open drain or pump a minimum of 1 inch per 10 feet to prevent clogging of the line. Seal around drain connection with suitable material to prevent air leakage into return air system.

Drain piping should not be smaller than drain connection at coil. An open vent in drain line will sometimes be required due to line length, friction and static pressure. Drains should be constructed in a manner to facilitate future cleaning.

NOTE - The condensate drain line MUST be trapped to provide proper drainage.

CAUTION
Condensate line connection must be hand-tightened. Do not use tools.

Supply & Return Duct Connections

The duct system should be designed and sized according to the methods in Manual Q of the Air Conditioning Contractors of America (ACCA).

A closed return duct system shall be used. This shall not preclude use of economizers or outdoor fresh air intake. It is recommended that supply and return duct connections at the unit be made with flexible joints.

The supply and return air duct systems should be designed for the CFM and static requirements of the job. They should NOT be sized by simply matching the dimensions of the duct connections on the unit.

CAUTION
When fastening duct system to side duct flanges on unit, insert screws through duct flanges only. Do not insert screws through casing. Outdoor duct must be insulated and waterproofed.

The 13GCSX unit is shipped ready for horizontal air discharge (side duct connections). If bottom air discharge is desired, the covers must be removed from the supply and return air openings on the bottom of the unit and re-installed to cover the side openings.

Filters

Filters are not factory-supplied with the unit; however, optional internally installed filter kits are available. Filter kit 92M54 is used with 2, 2-1/2 and 3-ton units. Filter kit 92M55 is used with 3-1/2, 4 and 5-ton units. The filter kits accommodate the use of 1", 2" or 4" filters. If the optional filter kit is not used, a filter must be field-installed.

Filters must always be installed ahead of evaporator coil and must be kept clean or replaced. Dirty filters will reduce the airflow of the unit. Filter sizes are shown in table 1.
Compressors

Units are shipped with the compressor mountings factory-adjusted and ready for operation.

⚠️ CAUTION
Do not loosen compressor mounting bolts.

Gas Supply and Piping

Check the unit rating plate to confirm whether unit is equipped for use with natural gas or LP/propane. If conversion is required use the approved conversion kit.

**NOTE** - Units are shipped equipped for natural gas, but can be converted to LP/propane with a conversion kit. Conversion must be performed by an approved licensed pipe fitter or technician.

All LP/propane gas equipment must conform to the safety standards of the National Fire Protection Association.

Complete information regarding tank sizing for vaporization, recommended regulator settings, and pipe sizing is available from most regulator manufacturers and LP/propane gas suppliers.

Proper sizing of gas piping depends on the cubic feet per hour of gas flow required, specific gravity of the gas and length of run. In the United States, the current National Fuel Gas Code Z223.1 should be followed in all cases unless superseded by local codes or gas company requirements. Refer to tables 2 and 3. In Canada, refer to the current CSA B.149 installation codes.

</tbody>
</table>

*Based on 1075 Btu per cubic foot of natural gas.

Before connecting piping, check with gas company or authorities having jurisdiction for local codes or requirements. When installing gas supply piping, length of run from gas meter must be considered in determining pipe size for 0.5 inch w.c. maximum pressure drop. Do not use supply pipe smaller than unit gas connection. For natural gas unit, supply pressure at the unit gas connection must be a minimum of 5 inches w.c. and a maximum of 10.5 w.c. For LP/propane gas units, supply pressure at the unit gas connection must be a minimum of 11 inches w.c. and a maximum of 13.0 inches w.c.

</tbody>
</table>

The gas supply piping should be routed through the grommet on the side of the unit. Refer to figure 7.

**Figure 7**

Gas Piping and Electrical Conduit Access

When making piping connections, a drip leg should be installed on vertical runs to serve as a trap for sediment or condensate. A 1/8 inch N.P.T. tap accessible for test gauge connection must be provided in field piping upstream from gas supply connection to unit. Install a ground joint union between gas control manifold and the manual main shut-off valve. See figure 8.

Compounds used on threaded joints of gas piping shall be resistant to the action of propane/LP gases.
Pressure Test Gas Piping

When pressure testing gas lines, the gas valve must be disconnected and isolated. Gas valve can be damaged if subjected to more than 0.5 psig (14 inch w.c.). See figure 9. If test pressure is equal to or less than 0.5 psig (14 inch w.c.) shut off the manual main shut-off valve before pressure testing to isolate unit from gas supply system.

NOTE - Codes may require that manual main shut-off valve and union (furnished by installer) be installed in gas line external to unit. Union must be of the ground joint type.

After gas piping is complete, carefully check all piping connections (factory and field) for gas leaks. Use soap solution or other preferred means.

CAUTION

Some soaps used for leak detection are corrosive to certain metals. Carefully rinse piping thoroughly after leak test has been completed. Do not use matches, candles, flame or other sources of ignition to check for gas leaks.

5 - The unit and its individual manual shut-off valve must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 PSIG (3.48kPa).

IMPORTANT

The unit must be isolated from the gas supply piping system by closing its individual manual shut-off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psig. See figure 9. The unit and its individual shut-off valve must be disconnected from the gas supply piping system during any pressure testing of the system at test pressures greater than 1/2 psig.

6 - A 1/8 inch N.P.T. plugged tapping, accessible for test gage connections, must be installed immediately upstream of the gas supply connection to the furnace.
Electrical

All wiring should be done in accordance with the current National Electric Code ANSI/NFPA No. 70 in the United States. In Canada, wiring must be done in accordance with the current CSA C22.2 Part 1. Local codes may take precedence.

Use wiring with a temperature limitation of 75°C min.; run the 208 or 230 volt, 60 hertz electric power supply through a fused disconnect switch to control box of unit and connect as shown in the wiring diagram located on the inside of the control access panel.

Unit must be electrically grounded in accordance with local codes or in the absence of local codes with the National Electric Code, ANSI/NFPA No. 70 (latest edition) or CSA C22.2 Part 1 (latest edition).

Power supply to the unit must be N.E.C. Class 1, and must comply with all applicable codes. A fused disconnect switch should be field provided for the unit. The switch must be separate from all other circuits. If any of the wire supplied with the unit must be replaced, replacement wire must be of the type shown on the wiring diagram.

Electrical wiring must be sized to carry minimum circuit ampacity marked on the unit. USE COPPER CONDUCTORS ONLY. Each unit must be wired with a separate branch circuit and be properly fused.

CAUTION

When connecting electrical power and control wiring to the unit, waterproof type connectors MUST be used so that water or moisture cannot be drawn into the unit during normal operation.

See figure 10 for field connection of line voltage wiring. See figure 11 for typical wiring diagram.

Thermostat

The room thermostat should be located on an inside wall where it will not be subject to drafts, sun exposure or heat from electrical fixtures or appliances. Follow manufacturer’s instructions enclosed with thermostat for general installation procedure. Color coded insulated wires (# 18 AWG) should be used to connect thermostat to unit. Four wires are required for cooling.

Heat Anticipator Setting

It is important that the anticipator setpoint be correct. Too high of a setting will result in longer heat cycles and a greater temperature swing in the conditioned space. Reducing the value below the correct setpoint will give shorter “ON” cycles and may result in the lowering of the temperature within the conditioned space.

Heat Anticipator Setting: 0.70 AMP
Blower Speed Settings

**WARNING**

Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

13GCSX units are equipped with an indoor blower that is controlled by the integrated ignition control board.

Factory settings for the blower speed jumpers are given in the wiring diagram in figure 11. Use tables 4, 5 and 6 to determine the correct air volume for operation in heat and cool mode.

To change blower speeds, move blower speed tap wire on the blower motor. Refer to figure 14.

NOTE - All air data is measured external to unit without air filters.

1 For down-flow air volume, add 0.05 in. w.g. (12 Pa) to duct static.
Cooling Start-Up

The cooling section is a complete factory package utilizing an air-cooled condenser. The system is factory-charged with R-410A refrigerant. The compressor is hermetically sealed, internally sprung and base-mounted with rubber-insolated hold-down bolts.

Pre-Start Check List:
1. Make sure refrigerant lines do not rub against the cabinet or each other.
2. Inspect all electrical wiring, both factory- and field-installed, for loose connections.
3. Check voltage at the disconnect switch. Voltage must be within the range listed on the unit nameplate. If not, consult power company and have voltage condition corrected before starting unit.
4. Recheck voltage with unit running. If power is not within the range listed on the unit nameplate, stop the unit and consult the power company. Check unit amperage. Refer to unit nameplate for correct running amps.
5. Make sure filter is in place before unit start-up.

Cooling Sequence of Operation

When the thermostat calls for cooling, “R” is closed to “G” and “Y” (figure 11). This completes the low voltage control circuit, energizing the compressor, condenser fan motor and blower motor.

**NOTE** - At the start of each cooling demand, the combustion air blower (draft motor) will operate for 10 seconds.

Unit compressors have internal protection. If there is an abnormal rise in the compressor temperature, the protector will open and the compressor will stop.

Blower Delay - Cooling

In the cooling mode, the circulating air blower operation is delayed for 5 seconds after the compressor starts. The blower continues to operate for 90 seconds after the compressor is de-energized.

**NOTE** - With the proper thermostat and subbase, continuous blower operation is possible by closing the R to G circuit. Cooling blower delay is also functional in this mode.

System Performance

For maximum performance of this cooling system, the operating temperatures and pressure should be checked and superheat determined at Standard ARI test conditions of 82°F outdoor temperature minus (−) 80°F indoor dry bulb / 67°F indoor wet bulb. If superheat measured deviates from values in table 7, refrigerant charge should be adjusted accordingly for maximum performance.

Verify system performance using table 8 as a general guide. Table 8 should not be used for charging unit. Minor variations in these pressures may be expected due to differences in installations. Significant differences could mean that the system is not properly charged or that a problem exists with some component in the system.

Used carefully, this table could serve as a useful service guide. Data is based on 80°F dry bulb / 87°F wet bulb return air. Allow unit operation to stabilize before taking pressure readings.

Heating Start-Up

Pre-Start Check List:
1 - Check the type of gas being supplied. Be sure it is the same as listed on the unit nameplate.
2 - Make sure the vent hood has been properly installed.

FOR YOUR SAFETY READ BEFORE LIGHTING
BEFORE LIGHTING the unit, smell all around the furnace area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WARNING
Electric shock hazard. Can cause injury or death. Do not use this unit if any part has been under water. Immediately call a qualified service technician to inspect the unit and to replace any part of the control system and any gas control which has been under water.

WARNING
Danger of explosion and fire. Can cause injury or product or property damage. You must follow these instructions exactly.

WARNING
Danger of explosion. Can cause injury or product or property damage. If overheating occurs or if gas supply fails to shut off, shut off the manual gas valve to the appliance before shutting off electrical supply.

WARNING
Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

The gas valve on may be equipped with either a gas control switch or gas control knob. Use only your hand to push the switch or turn the gas control knob. Never use tools. If the switch will not move or the knob will not push in or turn by hand, do not try to repair it. Call a qualified service technician. Force or attempted repair may result in a fire or explosion.

This unit is equipped with a direct ignition control. Do not attempt to manually light the burners.
1 - Turn off electrical power to unit.

2 - Set thermostat to lowest setting.
3 - Honeywell VR8205 Gas Valve with ON/OFF Switch - Set gas valve switch to ON. See figure 12. Honeywell VR8205 Gas Valve with Knob - Turn knob on gas valve counterclockwise to ON. Do not force. See figure 13.

4 - Turn on electrical power to unit.
5 - Set room thermostat to desired temperature. (If thermostat setpoint temperature is above room temperature after the pre-purge time expires, main burners will light).

To Shut Down:
1 - Turn off electric power to unit.
2 - Honeywell VR8205 Gas Valve with ON/OFF Switch - Set gas valve switch to OFF. Honeywell VR8205 Gas Valve with Knob - Turn gas valve knob clockwise to OFF. Do not force.

Post Start-up Check List (Gas)
After the control circuit has been energized and the heating section is operating, make the following checks:
1 - Use soap solution to check for gas leaks in the unit piping as well as the supply piping.
2 - Check for correct manifold gas pressures. See “Manifold Gas Pressure Adjustment.”
3 - Check the supply gas pressure. It must be within the limits shown on rating nameplate. Supply pressure should be checked with all gas appliances in the building at full fire. At no time should the supply gas pressure exceed 10.5 inches w.c., nor drop below 5.0 inches w.c. for natural gas units. For propane gas, supply gas pressure should not drop below 11 inches w.c. If gas pressure is outside these limits, contact your gas supplier for corrective action.

4 - Adjust temperature rise to the range specified on the rating plate.

Checking and Adjusting Gas Input

NOTE - Units must be converted for use with LP/propane gas. Conversion kit is ordered separately. Conversion must be performed by an approved licensed pipe fitter or technician.

The minimum permissible gas supply pressure is 5.0 inches W.C. for natural gas or 11.0 inches W.C. for LP/propane gas. The maximum inlet gas supply pressure is 10.5 inches W.C. for natural gas and 13.0 inches W.C. for LP/propane gas. Gas input must never exceed the input capacity shown on the rating plate.

Units fueled by natural gas are rated for manifold pressures of 3.5 inches W.C.

Units fueled by LP/propane gas are rated for manifold pressures of 10.0 inches W.C.

Measure manifold pressure: Shut off gas supply to the unit. Remove plug from pressure tap. See figure 12 or 13. Connect manometer or gauge to the proper pressure tap, then turn on the gas supply.

The Honeywell VR8205 gas valve has an adjusting screw. See figure 12 or 13 for adjusting screw location. Remove the cap and turn the adjusting screw clockwise to increase pressure and input; turn counterclockwise to decrease pressure and input. The pressure regulator adjustment is sensitive. One turn of the adjusting screw results in a large change in manifold pressure. Replace the adjusting screw cap.

Final manifold pressure must be within the allowable range for the gas being used.

For Natural Gas: Check the furnace rate by observing gas meter, making sure all other gas appliances are turned off. The test hand on the meter should be timed for at least one revolution. Note the number of seconds for one revolution.

\[
\text{BTU/HR} = \frac{\text{Cubic Feet Per Revolution}}{\text{No. Seconds Per Revolution}} \times 3600 \times \text{Heating Value}
\]

For LP/Propane Gas: The only check for the output rate is to properly adjust the manifold pressure using a manometer. Typical manifold setpoint for installations at altitudes from 0 to 4500 feet above sea level is 10.0 inches W.C.

High Altitude Information

Ratings shown on the rating plate for elevations up to 4,500 feet. For elevations above 4,500 feet, ratings should be reduced at a rate of four percent for each 1,000 feet above sea level. See National Fuel Gas Code Z223.1 (latest edition) or the requirements of the CSA B149 installation codes.

Heating Sequence of Operation

When the thermostat calls for heating, W1 is energized. The ignition control checks high temperature limit and rollout switches to make sure they are closed. The control then verifies that the pressure switch is open. If the pressure switch is closed, the control will flash code 3 on the LED and will wait indefinitely for the pressure switch to open. If the pressure switch is open, the control proceeds to the 30-second pre-purge.

The ignition control energizes the combustion air inducer, flashes a code 3 on the LED, and waits for the pressure switch to close.

When the pressure switch has closed, the LED code 3 flash stops and the control begins the 30-second pre-purge period. When the pre-purge time has expired, the control begins the ignition trial.

The ignition control energizes the gas valve, spark electrode and flame sensor. If the flame is established within 10 seconds, the control de-energizes the spark. If flame is not established within 10 seconds, the gas valve and spark are de-energized. The ignition control will initiate three ignition trials. If the flame sensor does not sense an established flame at the end of the third ignition trial, the ignition control will allow a 1-hour Watchguard period to pass before allowing additional ignition trials.

Approximately 30 seconds after the flame has been established, the circulating air blower starts. The ignition control inputs are continuously monitored to ensure that limit switch(es), rollout switch and pressure switch are all closed, and that the flame remains established and heating demand is present.

When the heating demand is satisfied, the control immediately de-energizes the gas valve and combustion air inducer. The circulating air blower operates for 120 seconds after the gas valve is de-energized.

Blower Delay - Heating

In the heating mode, the circulating air blower operation is delayed for 30 seconds after the flame is established. The blower continues to operate for 120 seconds after the gas valve is de-energized.

NOTE - With the proper thermostat and subbase, continuous blower operation is possible by closing the R to G circuit.
Integrated Ignition Control Board (A3)
The 13GCSX unit includes an integrated ignition control board which controls the combustion air inducer, gas valve, spark electrode and indoor blower. The control board receives signals from the main and auxiliary limit switches, the rollout switch, the pressure switch and the flame sensor. LED codes and flash rates are given on page 16. The ignition control board is shown in figure 14.
Integrated Ignition Control Board LED Codes

The ignition control board LED flashes codes which indicate normal or abnormal operations:

**Slow Flash** -- Normal operation, no call for heat.
One flash per second.

**Fast Flash** -- Normal operation, call for heat.
Two flashes per second.

**Steady On** -- Internal control failure.
(Micro-controller failure; self-check).

**Code 2** -- System lockout -- Failed to detect or sustain flame.
Two flashes in 1 second with a 1-second pause.

**Code 3** -- Pressure switch senses incorrect pressure or is stuck in the closed position.
Three flashes in 1-1/2 seconds with a 1-second pause.

**Code 4** -- Main limit or rollout switch open.
Four flashes in 2 seconds with a 1-second pause.

**Code 5** -- Flame sensed while gas valve de-energized.
Five flashes in 2-1/2 seconds with a 1-second pause.

**Limit Control**

This control is located inside the heating compartment and is designed to open at abnormally high air temperatures. It resets automatically. The limit switch operates when a high temperature condition, caused by inadequate blower supply airflow, occurs. The main gas valve is closed. The circulating air blower will continue to operate until the limit control closes and the blower off delay period has elapsed.

**Pressure Switch**

If the combustion air inducer motor should fail or if the vent system is blocked, the pressure switch prevents the gas valve from being energized.

**Spark Electrode and Flame Sensor Rod**

The spark electrode and flame sensor rod are part of the burner assembly. The spark electrode is typically located on the far-left burner. The flame sensor rod is typically located on the far-right burner. If the ignition control does not receive a signal from the flame sensor indicating that the burners have established flame, the main gas valve will close after the 10-second ignition trial period built into the ignition control.

**Rollout Switch**

The switch is located above the main burners. In the event of a sustained main burner rollout the main gas valve is closed. To reset, push the button on top of the switch.

**Auxiliary Limit (-42, -48 & -60 units only)**

This control is located in the side of the circulating air blower housing. If the circulating air blower fails to operate, the temperature rises and opens the auxiliary limit. The main gas valve closes. This control resets automatically.

**Condenser Fan Clearances**

The top of the condenser fan should be 1-1/2 inches from the bottom of the top grille. This dimension should be checked and the fan should be adjusted accordingly any time servicing of the outdoor fan system is required.
**Maintenance**

Periodic inspection and maintenance normally consists of changing or cleaning filters and (under some conditions) cleaning the main burners.

**Filters**

Not supplied. Inspect once a month. Replace disposable or clean permanent type as necessary. DO NOT replace permanent type with disposable.

**Motors**

Indoor, outdoor fan and vent motors are permanently lubricated and require no further lubrication. Motors should be cleaned yearly to prevent the accumulation of dust and dirt on the windings or motor exterior.

**Coil**

Dirt and debris should not be allowed to accumulate on the coil surfaces or other parts in the air conditioning circuit. Cleaning should be performed as often as necessary. Use a brush, vacuum cleaner attachment, or other suitable means. If water is used to clean the coil, be sure the power to unit is shut off prior to cleaning.

*NOTE - Care should be used when cleaning the coil so that the coil fins are not damaged.*

Do not permit the hot condenser air discharge to be obstructed by overhanging structures or shrubs.

**To Clean Burners**

Light the burners and allow unit to operate for a few minutes to establish normal burning conditions. Observe the burner flames. Compare this observation to figure 15 to determine if flame is properly adjusted. Flame should be predominantly blue in color and strong in appearance. Verify that all burners are lit and that the flame does not impinge on the sides of the heat exchanger.

Distorted flame or yellow tipping of the natural gas flame (or long yellow tips on LP/propane flame) may be caused by one or more of the following: lint or dirt inside the burner or burner ports; lint or dirt at the air inlet between the burner and manifold pipe; or an obstruction over the burner orifice.

Use a soft brush or vacuum to clean the affected areas.

**Vent Outlet**

Visually inspect vent outlet periodically to make sure that there is no buildup of soot and dirt. If necessary, clean to maintain adequate opening to discharge flue products.

**Planned Services**

You should expect a service technician to check the following items during an annual inspection. Power to the unit must be shut off for the service technician’s safety.

- Fresh air grilles and louvers Must be open and unobstructed to provide combustion air.
- Burners must be inspected for rust, dirt, or signs of water.
- Exhaust pipe must be inspected for signs of water, damaged Rust or disconnected joints.
- Unit appearance must be inspected for rust, dirt, signs of water, burnt or damaged wires, or components. A good coat of auto wax can extend the appearance.
- Blower access door must be properly in place.
- Return air duct must be properly attached and provide an air seal to the unit.
- Operating performance — Unit must be observed during operation to monitor proper performance of the unit and the vent system.
- Combustion gases — Flue products must be analyzed and compared to the unit specifications.

Problems detected during the inspection may make it necessary to temporarily shut down the furnace until the items can be repaired or replaced.

Pay attention to your unit. Situations can arise between annual furnace inspections that may result in unsafe operation. For instance, items innocently stored next to the unit may obstruct the combustion air supply. This could cause incomplete combustion and the production of carbon monoxide gas.
Repair Parts & Accessories

The following repair parts are available from your local dealer. When ordering parts, include the complete model number and serial number which are printed on the unit rating plate. All service must be performed by a licensed professional installer (or equivalent), service agency, or gas supplier.
