NOTICE

A thermostat is not included and must be ordered separately.
- The Lennox icomfort Touch™ thermostat must be used in communicating applications.
- In non-communicating applications, the Lennox ComfortSense® 7000 thermostat may be used, as well as other non-communicating thermostats.

In all cases, setup is critical to ensure proper system operation.
Field wiring for both communicating and non-communicating applications is illustrated in diagrams, which begin on page 13.

WARNING

Improper installation, adjustment, alteration, service or maintenance can cause personal injury, loss of life, or damage to property.
Installation and service must be performed by a licensed professional installer (or equivalent) or a service agency.

Shipping and Packing List

Check unit for shipping damage. Consult last carrier immediately if damage is found.

Package 1 of 1 contains the following:
1 — Assembled air handler unit
2 — Downflow shields (if required for downflow configuration only)
1 — Drip shield (for -068 only)

IMPORTANT INFORMATION TO INSTALLER

CHECK FOR AND REMOVE THE FOLLOWING ITEMS BEFORE OPERATING UNIT.

A BLOWER HOUSING SUPPORT PAD. B TOP CAP SHIPPING BRACKET (REPLACE SCREWS IN TOP CAP AFTER REMOVAL).
C HORIZONTAL DRAIN PAN (SEE UPFLOW APPLICATIONS ON PAGE 5 AND DOWNFLOW APPLICATIONS ON PAGE 8)
D REFRIGERANT LINE PLUGS (SEE BRAZING CONNECTION ON PAGE 9)

FOR PROPER OPERATION THE ELECTRIC HEAT (IF APPLICABLE) MUST BE CONFIGURED (SET-UP) THROUGH THE AIR HANDLER CONTROL (AHC)

WHENEVER ELECTRIC HEAT IS INSTALLED THE AHC MUST BE MANUALLY CONFIGURED. SEE JUMPERS AND LINKS GUIDE ON PAGE 20.

CONFIGURE ELECTRIC HEAT

ELECTRIC HEAT SECTIONS MUST BE CONFIGURED. IF INSTALLED SEE PROCEDURE IN FIGURE 24 ON PAGE 30.

ECB40

### General

This indoor unit is designed for installation with optional field-installed electric heat and a matched remote outdoor unit that is charged with HFC-410A refrigerant. These units, designed for indoor installation in multiple positions, are completely assembled for upflow and horizontal right-hand discharge before being shipped from the factory.

All CBX32MV air handlers are equipped with a factory-installed, internally mounted check / expansion valve (CTXV), which is suitable for use in HFC-410A applications.

This air handler is compatible with the ComfortSense® 7000 non-communicating thermostat and non-communicating outdoor units. In addition, this unit has the enhance capability of communicating with the icomfort Touch® thermostat and compatible outdoor units using the Lennox RSBus protocols.

**NOTE — For downflow or horizontal left-hand air discharge, certain field modifications are required.**

These instructions are intended as a general guide and do not supersede local or national codes in any way. Consult authorities having jurisdiction before installation. Check equipment for shipping damage; if found, immediately report damage to the last carrier.

### Installation Clearances

<table>

</tr>
</tbody>
</table>

1 Units installed on combustible floors in the down-flow position with electric heat require optional down-flow additive base.

2 Front service access - 24 inches (610mm) minimum.

**NOTE — If cabinet depth is more than 24 inches (610 mm), allow a minimum of the cabinet depth plus 2 inches (51 mm).**

### IMPORTANT

The Clean Air Act of 1990 bans the intentional venting of refrigerant (CFCs, HCFCs and HFCs) as of July 1, 1992. Approved methods of recovery, recycling or reclaiming must be followed. Fines and/or incarceration may be levied for noncompliance.

### WARNING

During blower operation, the ECM motor emits energy that may interfere with pacemaker operation. Interference is reduced by both the sheet metal cabinet and distance.

### CAUTION

Physical contact with metal edges and corners while applying excessive force or rapid motion can result in personal injury. Be aware of, and use caution when working near these areas during installation or while servicing this equipment.

### WARNING

Product contains fiberglass wool.

Disturbing the insulation in this product during installation, maintenance, or repair will expose you to fiberglass wool. Breathing this may cause lung cancer. (Fiberglass wool is known to the State of California to cause cancer.)

Fiberglass wool may also cause respiratory, skin, and eye irritation.

To reduce exposure to this substance or for further information, consult material safety data sheets available from address shown below, or contact your supervisor.

Lennox Industries Inc.
P.O. Box 799900
Dallas, TX 75379-9900
**WARNING**

Improper installation of the air handler can result in personal injury or death.
Do not allow external combustion products or other contaminants to enter the return air system or to be mixed with air that will be supplied to the living space. Use sheet metal screws and joint tape or duct mastic to seal return air system to air handler. In platform installations, the air handler should be sealed airtight to the return air plenum. A door must never be used as a portion of the return air duct system. The base must provide a stable support and an airtight seal to the air handler. Allow absolutely no sagging, cracks, gaps, etc. For no reason should return and supply air duct systems ever be connected to or from other heating devices such as a fireplace or stove, etc. Fire, explosion, carbon monoxide poisoning, personal injury and/or property damage could result.

**Requirements**

In addition to conforming to manufacturer's installation instructions and local municipal building codes, installation of Lennox air handler units (with or without optional electric heat), MUST conform with the following National Fire Protection Association (NFPA) standards:

- NFPA No. 90A — Standard for Installation of Air Conditioning and Ventilation Systems
- NFPA No. 90B — Standard for Installation of Residence Type Warm Air Heating and Air Conditioning Systems

This unit is approved for installation clearance to combustible material as stated on the unit rating plate. Accessibility and service clearances must take precedence over combustible material clearances.

**Installing the Unit**

CBX32MV units are factory-configured for upflow and horizontal right-hand discharge installation. For downflow or horizontal left-hand discharge, certain field modifications are required.

**DISASSEMBLE AND REASSEMBLE AIR HANDLER UNIT**

This unit consists of two sections which are shipped assembled from the factory. If necessary, the unit may be disassembled to facilitate setting the unit. Follow the steps below:

**To disassemble:**

1. Remove access panels.
2. Remove both blower and coil assemblies. This will lighten the cabinet for lifting.
3. Remove one screw from the left and right posts inside the unit. Remove one screw from each side on the back of the unit. Unit sections will now separate.

**To reassemble:**

1. Align cabinet sections together.
2. Reinstall screws.

3. Replace blower and coil assemblies.
4. Replace access panel.

**UPFLOW APPLICATION**

Use the following procedures to configure the unit for upflow operations:

![Figure 1. Upflow Configuration](image)

Note — (-068 model Only) Remove access panels and the horizontal drip shield along with the corrugated padding between the blower and coil assembly before operation. Discard drip shields from the foam pads on top of the unit. Shields are used for downflow applications only.

1. The horizontal drain pan must be removed when the coil blower is installed in the upflow position. Removing horizontal drain pain will allow proper airflow and increase efficiency.
2. After removing horizontal drain pan, place the unit in desired location. Set unit so that it is level. Connect return and supply air plenums as required using sheet metal screws as illustrated in figure 1.
3. Install units that have no return air plenum on a stand that is at least 14" from the floor to allow for proper air return. Lennox offers an optional upflow unit stand as listed in table 1.

**Table 1. Optional Unit Side Stand (Upflow Only)**

<table>

</tr>
</tbody>
</table>

**HORIZONTAL RIGHT — HAND DISCHARGE APPLICATION**

**NOTE** — When air handler is located above a finished space, the secondary drain pan must have a larger footprint than the air handler. In addition, a 3/4" (19.1MM) overflow drain line must be:

- Connected to secondary drain pan
- Connected to the overflow drain outlet of the air handler drain pan.

Use the following procedures to configure the unit for horizontal right-hand discharge operations:

**NOTE** — For horizontal applications, a secondary drain pan is recommended. Refer to local codes.
NOTE — (-068 Model Only) Before operating the unit, remove access panels and the horizontal drip shield and the corrugated padding between the blower and coil assembly. Discard the corrugated padding and the downflow drip shields from the foam pads on top of the unit.

NOTE — (-068 Model Only) Install the horizontal shield on the front edge of the horizontal drain pan as illustrated in figure 2.

1. No further adjustment is necessary. Set unit so that it is sloped 1/4 inch (6.35mm) towards the drain pan end of the unit.

2. Remove the downflow rail then replace screws.

3. Seal around the exiting drain pipe, liquid line, and suction line to prevent humid air from infiltrating into the unit.

**IMPORTANT**

When removing the coil, there is possible danger of equipment damage and personal injury. Be careful when removing the coil assembly from a unit installed in right- or left-hand applications. The coil may tip into the drain pan once it is clear of the cabinet. Support the coil when removing it.

Figure 2. Right-Hand Discharge Configuration

2. If the unit is suspended, the entire length of the cabinet must be supported. If you use a chain or strap, use a piece of angle iron or sheet metal attached to the unit (either above or below) to support the length of the cabinet. Use securing screws no longer than 1/2 inch (12.7mm) to avoid damaging the coil or filter as illustrated in figure 3. Use sheet metal screws to connect the return and supply air plenums as required.

HORIZONTAL RIGHT-HAND DISCHARGE APPLICATION IN HIGH HUMIDITY AREAS

For horizontal applications in high humidity areas remove the downflow rail closest to the drain pan.

To remove rail:

1. Remove the screws from the rail at the back of unit and at the cabinet support rail.

HORIZONTAL LEFT-HAND DISCHARGE APPLICATION

Use the following procedures to configure the unit for horizontal left-hand discharge operations:

NOTE — For horizontal applications, a secondary drain pan is recommended. Refer to local codes.

NOTE — (-068 Model Only) Remove access panels and horizontal drip shield from the corrugated padding between the blower and coil assembly. Discard the corrugated padding and the downflow drip shields from the foam pads on top of the unit. (The shields are used for downflow applications only.)

Figure 3. Suspending Horizontal Unit
**IMPORTANT**

After removal of drain pan plug(s), check drain hole(s) to verify that drain opening is fully open and free of any debris. Also check to make sure that no debris has fallen into the drain pan during installation that may plug up the drain opening.

1. Pull the coil assembly from unit. Pull off the horizontal drain pan.
2. Remove the drain plugs from back drain holes on horizontal drain pan and reinstall them on front holes.
3. Rotate drain pan 180° front-to-back and install it on the opposite side of the coil.
4. Remove screws from top cap as illustrated in figure 4, detail A.
5. Remove horizontal drip shield screw located in the left center of the back coil end seal as illustrated in figure 4, detail A.
6. Rotate horizontal drip shield 180° front to back.
7. Remove plastic plug from hole located on the left center of front coil end seal and reinstall plug in back hole on rear coil end seal.
8. Reinstall horizontal drip shield screw in front coil end seal. Drip shield should drain downward into horizontal drain pan inside coil.
9. Rotate top cap 180° front-to-back and align with unused screw holes. Holes must align with front and back coil end plates. The top cap has a 45° bend on one side and a 90° bend on the other. The 90° bend must be on the same side as the horizontal drain pan as illustrated in figure 4, detail B.

**NOTE** — Be very careful when you reinstall the screws into coil end plate engaging holes. Misaligned screws may damage the coil.

10. From the upload position, flip cabinet 90° to the left and set into place. Replace coil assembly. Replace coil assembly. Install drain pan between exterior inner wall and tab as illustrated in figure 4, detail C.
11. *(068 Model Only)* Install the horizontal shield on the front edge of the horizontal drain pan as shown in figure 5.
NOTE — For horizontal applications in high humidity areas, remove the downflow rail closest to the drain pan. To remove rail, remove screw from rail at back of unit and at cabinet support rail. Remove downflow rail then replace screws. Also, seal around the exiting drain pipe, liquid and suction lines to prevent infiltration of humid air.

12. Knock out drain seal plate from access door. Secure plate to cabinet front flange with screw provided.

13. Flip access door and replace it on the unit.

14. Set unit so that it is sloped 1/4 inch (6.35mm) toward the drain pan end of the unit. Connect return and supply air plenums as required using sheet metal screws.

15. If suspending the unit, it must be supported along the entire length of the cabinet. If using chain or strap, use a piece of angle iron or sheet metal attached to the unit (either above or below) so that the full length of the cabinet is supported. Use securing screws no longer than 1/2 inch (12.7mm) to avoid damage to coil or filter as illustrated in figure 3 on page 6. Connect return and supply air plenums as required using sheet metal screws.

DOWNFLOW APPLICATION

Use the following procedures to configure the unit for downflow operations:

---

**CAUTION**

If electric heat section with circuit breakers (ECB29/ECB31) is applied to downflow CBX32MV unit, the circuit breakers must be rotated 180° to the UP position. See ECB29/ECB31 installation instructions for more details.

Table 2 outlines the sizes of the various drip shields.

**NOTE — (-068 Model Only)** Remove access panels and horizontal drip shield from the corrugated padding between the blower and coil assembly.

**NOTE — Discard the corrugated padding and the downflow drip shields from the foam pads on top of the unit. (The shields are used for downflow applications only.)**

1. Remove the coil assembly from the unit.

2. For best efficiency and air flow, remove the horizontal drain pan from the units in downflow positions as illustrated in figure 6 on page 8.

3. Rotate cabinet 180° from the upright position. See figure 6. You may need to first remove the blower assembly to lighten the cabinet for lifting.

4. Foam tape that is provided creates a seal between the drip shield and the coil so that water does not leak into the air stream. The foam tape pieces are precut. Apply the tape to the drip shields as illustrated in figure 7 and specified as follows:

   - Apply the longer piece of 1-inch wide foam tape between the end pieces of tape.

5. From the underside of the coil, install the downflow drip shield firmly in place as illustrated in figure 8.

</tbody>
</table>

---

6. Replace the coil assembly and blower if you have removed it. Replace the coil access panel.
7. Set the unit so that it is level. Using sheet metal screws, connect the return and supply air plenums as required.

NOTE - For downflow application, metal or class I supply and return air plenums must be used.

Figure 9. Downflow Combustible Flooring Base

8. For downflow installation on combustible flooring, an additive base must be used as illustrated in figure 9 on page 9. See CBX32MV Engineering Handbook for downflow combustible flooring base kits available for this air handler.

9. Cut an opening appropriately sized for combustible base. Base dimensions are illustrated in figure 10. After opening has been cut, set the additive base into opening. Connect outlet air plenum to the additive base. Set the unit on the additive base so flanges of the unit drop into the base opening and seal against the insulation strips. The unit is now locked in place. Install return air plenum and secure with sheet metal screws.

Figure 10. Downflow Combustible Base Dimensions

Brazing Connections

WARNING

Polyol ester (POE) oils used with HFC-410A refrigerant absorb moisture very quickly. It is very important that the refrigerant system be kept closed as much as possible. DO NOT remove line set caps or service valve stub caps until you are ready to make connections.

WARNING

Danger of fire. Bleeding the refrigerant charge from only the high side may result in the low side shell and suction tubing being pressurized. Application of a brazing torch while pressurized may result in ignition of the refrigerant and oil mixture - check the high and low pressures before unbrazing.

WARNING

When using a high pressure gas such as dry nitrogen to pressurize a refrigeration or air conditioning system, use a regulator that can control the pressure down to 1 or 2 psig (6.9 to 13.8 kPa).

CAUTION

Brazing alloys and flux contain materials which are hazardous to your health. Avoid breathing vapors or fumes from brazing operations. Perform operations only in well ventilated areas. Wear gloves and protective goggles or face shield to protect against burns. Wash hands with soap and water after handling brazing alloys and flux.

IMPORTANT

To prevent the build up of high levels of nitrogen when purging, be sure it is done in a well ventilated area. Purge low pressure nitrogen (1 to 2 psig) through the refrigerant piping during brazing. This will help to prevent oxidation and the introduction of moisture into a system.
PLEASE READ IMPORTANT ISSUES CONCERNING BRAZING OPERATIONS ON PAGE 10 BEFORE PROCEEDING.

C USE A WET RAG TO PROTECT CTXV SENSING BULB WHEN BRAZING SUCTION LINE CONNECTIONS.

NOTE — REFER TO OUTDOOR UNIT INSTALLATION INSTRUCTIONS FOR REFRIGERANT PIPING SIZE REQUIREMENTS.

NOTE - Use silver alloy brazing rods with five or six percent minimum silver alloy for copper-to-copper brazing, 45 percent alloy for copper-to-brass and copper-to-steel brazing.

A REMOVE ACCESS PANEL

B REMOVE RUBBER PLUG FROM BOTH LIQUID AND SUCTION LINES
NOTE — CBX3MV SERIES UNITS USE NITROGEN OR DRY AIR AS A HOLDING CHARGE. IF THERE IS NO PRESSURE WHEN THE RUBBER PLUGS ARE REMOVED, CHECK THE COIL FOR LEAKS BEFORE INSTALLING.

D EITHER REMOVE OR PUSH PIPE WRAPPING BACK THROUGH HOLE IN PIPING PLATE BEFORE LINE SET CONNECTION AND BRAZING.

C USE A WET RAG TO PROTECT CTXV SENSING BULB WHEN BRAZING SUCTION LINE CONNECTIONS.

F CONNECT GAUGES AND START NITROGEN FLOW

FLOW REGULATED NITROGEN (AT 1 TO 2 PSIG) THROUGH THE REFRIGERATION GAUGE SET INTO THE VALVE STEM PORT CONNECTION ON THE OUTDOOR UNIT LIQUID LINE SERVICE VALVE AND OUT OF THE VALVE STEM PORT CONNECTION ON THE SUCTION SERVICE VALVE.

G PLACE A WET RAG AGAINST PIPING PLATE AND AROUND THE SUCTION LINE CONNECTION. A

H BRAZE CONNECTION. ALLOW PIPE TO COOL BEFORE REMOVING WET RAG FROM CTXV SENSING BULB AND PIPING PANEL AREA.

I REPEAT PREVIOUS PROCEDURE FOR LIQUID LINE.

NOTE /C0266 REFER TO OUTDOOR UNIT INSTALLATION INSTRUCTIONS FOR REFRIGERANT PIPING SIZE REQUIREMENTS.

NOTE /C0266 REFRIGERANT LINE SETS SHOULD BE ROUTED TO ALLOW FILTER ACCESSIBILITY.

NOTE /C0266 CBX3MV SERIES UNITS USE NITROGEN OR DRY AIR AS A HOLDING CHARGE. IF THERE IS NO PRESSURE WHEN THE RUBBER PLUGS ARE REMOVED, CHECK THE COIL FOR LEAKS BEFORE INSTALLING.

REFER TO INSTRUCTIONS PROVIDED WITH OUTDOOR UNIT FOR LEAK TESTING, EVACUATING AND CHARGING PROCEDURES.

</tbody>
</table>

**NOTE —** Some applications may required a field provided 7/8" to 1-1/8" adapter

**NOTE —** When installing refrigerant lines longer than 50 feet, see the Lennox Refrigerant Piping Design and Fabrication Guidelines, CORP. 9351-L9, or contact Lennox Technical Support Product Applications for assistance. To obtain the correct information from Lennox, be sure to communicate the following information:

#### Installing the Condensate Drain

**IMPORTANT**

After removal of drain pan plug(s), check drain hole(s) to verify that drain opening is fully open and free of any debris. Also check to make sure that no debris has fallen into the drain pan during installation that may plug up the drain opening.

---

**MAIN DRAIN**

Connect the main drain and route downward to drain line or sump. Do not connect drain to a closed waste system. See Figure 13 for typical drain trap configuration.

**OVERFLOW DRAIN**

It is recommended that the overflow drain is connected to a overflow drain line for all units. If overflow drain is not connected, it must be plugged with provided cap.

For downflow orientation, the overflow drain **MUST** be connected and routed to a overflow drain line. See Figure 13 for main and overflow drain locations based on coil orientation.

![Figure 12. Main and Overflow Drain Locations based on Coil Orientation](image)

**BEST PRACTICES**

The following best practices are recommended to ensure better condensate removal:

- Main and overflow drain lines should **NOT** be smaller than both drain connections at drain pan.
- Overflow drain line should run to an area where homeowner will notice drainage.
- It is recommended that the overflow drain line be vented and a trap installed. Refer to local codes.
ABOVE FINISHED SPACE?

OVERFLOW DRAIN LINE

ALWAYS RUN AN OVERFLOW DRAIN LINE. IF NOT POSSIBLE TO ROUTE OVERFLOW DRAIN LINE, INSTALL LOW VOLTAGE OVERFLOW SWITCH KIT. WIRE KIT TO SHUT DOWN COMPRESSOR PER INSTRUCTIONS.

Note — When a air handler is located above a finished space the secondary drain pan must have a larger footprint than the air handler.

Secondary drain pan

When a coil is located above a finished space, a 3/4" (19.1mm) secondary drain line must be:
• connected to secondary drain pan
• connected to the overflow drain outlet of the air handler drain pan.

Traps must be deep enough to offset maximum static differences — generally, two inches (51mm).

*Lennox P-trap 49P66 requires a larger installation space than the J-trap 91P90.

Figure 13. Typical Main and Overflow Drain Installations

Inspecting and Replacing Filters

⚠️ IMPORTANT

Filter access door must be in place during unit operation. Excessive warm air entering the unit from unconditioned space may result in water blow-off problems.

Filters may be duct-mounted or installed in the cabinet. A filter is installed at the factory. Note that filter access door fits over access panel. Air will leak if the access panel is placed over the filter door.

Filters should be inspected monthly and must be cleaned or replaced when dirty to assure proper furnace operation.

To replace filter:
1. Loosen the thumbscrews holding the filter panel in place.
2. Slide the filter out of the guides on either side of cabinet.
3. Insert new filter.
4. Replace panel.

See table 4 for replacement filter sizes.

</tbody>
</table>

Sealing the Unit

⚠️ WARNING

There must be an airtight seal between the bottom of the air handler and the return air plenum. Use fiberglass sealing strips, caulk, or equivalent sealing method between the plenum and the air handler cabinet to ensure a tight seal. Return air must not be drawn from a room where this air handler or any gas-fueled appliance (i.e., water heater), or carbon monoxide-producing device (i.e., wood fireplace) is installed.
Seal the unit so that warm air is not allowed into the cabinet. Warm air introduces moisture, which results in water blow-off problems. This is especially important when the unit is installed in an unconditioned area.

Make sure the liquid line and suction line entry points are sealed with either the provided flexible elastomeric thermal insulation, or field provided material (e.g. Armaflex, Permagum or equivalent). Any of the previously mention materials may be used to seal around the main and auxiliary drains, and around open areas of electrical inlets.

**Field Control Wiring**

**WARNING**

Electric Shock Hazard. 
Can cause injury or death.
Foil-faced insulation has conductive characteristics similar to metal. Be sure there are no electrical connections within a ½” of the insulation. If the foil-faced insulation comes in contact with electrical voltage, the foil could provide a path for current to pass through to the outer metal cabinet. While the current produced may not be enough to trip existing electrical safety devices (e.g. fuses or circuit breakers), the current can be enough to cause an electric shock hazard that could cause personal injury or death.

Wiring must conform to the current National Electric Code ANSI/NFPA No. 70, or Canadian Electric Code Part I, CSA Standard C22.1, and local building codes. Refer to following wiring diagrams. See unit nameplate for minimum circuit ampacity and maximum over-current protection size.

**WARNING**

Run 24V Class II wiring only through specified low voltage opening. Run line voltage wiring only through specified high voltage opening. Do not combine voltage in one opening.

Select the proper supply circuit conductors in accordance with tables 310-16 and 310-17 in the National Electric Code, ANSI/NFPA No. 70 or tables 1 through 4 in the Canadian Electric Code, Part I, CSA Standard C22.1.

Separate openings have been provided for 24V low voltage and line voltage. Refer to the dimension illustration of specific location.

**CAUTION**

USE COPPER CONDUCTORS ONLY.

**WIRING CONNECTIONS**

1. Install line voltage power supply to unit from a properly circuit breaker.
2. Ground unit at unit disconnect switch or to an earth ground.

**NOTE** — Connect conduit to the unit using a proper conduit fitting. Units are approved for use only with copper conductors. A complete unit wiring diagram is located on the back side of the unit’s access panel.

3. Install low voltage wiring from outdoor to indoor unit and from thermostat to indoor unit.

**NOTE** — For proper voltages, select control wiring gauge per the charts on page 19.
Figure 14. CBX32MV Air Handler Unit Typical Wiring Diagram
NOTE - Due to varying duct designs and airflow conditions, relocation of the discharge sensor may be required to insure accurate sensing.

**DETAIL A**

THE AIR HANDLER CONTROL (AHC) HAS TWO SCREW TERMINALS MARKED DISCHARGE AIR SENSOR. THE SENSOR IS REQUIRED FOR EVENHEAT OPERATION, IS FIELD-MOUNTED AND MUST BE ORDERED SEPARATELY (CATALOG # 88K38).

CAUTION

Electrostatic Discharge (ESD) Precautions and Procedures

Electrostatic discharge can affect electronic components. Take precautions during unit installation and service to protect the unit's electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the unit, the control, and the technician at the same electrostatic potential.

Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface before performing any service procedure.

Electrostatic Discharge (ESD) Precautions and Procedures

Electrostatic discharge can affect electronic components. Take precautions during unit installation and service to protect the unit's electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the unit, the control, and the technician at the same electrostatic potential.

Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface before performing any service procedure.

Figure 19. Control (Field Wiring) — Cooling Application (Humiditrol® and Second-Stage Outdoor Fan Relay Wiring) Non-Communicating

Figure 20. Control (Field Wiring) — Heat Pump Application (Humiditrol® and Second-Stage Outdoor Fan Relay Wiring) Non-Communicating
SENSOR CONNECTIONS AND WIRING REQUIREMENTS

The following are sensor connections and wiring requirements for the discharge air and outdoor air sensors.

**Discharge Sensor (DAT)**
The Air Handler Control has two screw terminals marked **Discharge Air Sensor**. The sensor is REQUIRED for EVENHEAT operation and is field mounted and ordered separately using Lennox Catalog # 88K38.

In the EVENHEAT mode, the discharge air sensor cycles the electric heating elements as needed to maintain the Air Handler control EVENHEAT jumper selected discharge setpoint.

The discharge air sensor should be mounted downstream of the electric heat elements as illustrated in figure 15, detail A. It must be placed in a location with unobstructed airflow, where other accessories (such as humidifiers, UV lights, etc.) will not interfere with its accuracy.

Wiring distance between the Control and the discharge air sensor should not exceed 10 feet (3 meters) when wired with 18-gauge thermostat wire.

**Outdoor Air Sensor**
This is a two screw terminal for connection to a Lennox X2658 outdoor temperature sensor. The Control takes no action on the sensor status other than to communicate the temperature to the RSBus network. Wiring distance between the AHC and outdoor temperature sensor should not exceed 200 feet when wired with 18-gauge thermostat wire.

- Minimum temperature: -40°F (-40°C)
- Maximum temperature: 70°F (158°C)

**AIR HANDLER CONTROL 9-PIN CONNECTOR (P8)**

1. Air Handler (no electric heat) — Two wire factory harness (wired to pins 7 and 8) which provides 230 VAC power to Air Handler Control.

2. Air Handler (with electric heat) — Eight wire factory harness (all pin position are wired as noted in table 5).

**NOTE** — See figure 15, detail B for wire colors.

Figure 21. Air Handler Configuration
Air Handler Control Button, Display and Jumpers

Use figure 21 as reference for jumper settings. If any of the reference jumpers are missing, the Air Handler Control will display Error Code 130 as per table 10, and the Air Handler Control will automatically use the factory default setting show in figure 21

⚠ IMPORTANT

Before changing any clipable links or jumper settings, make sure the motor has completely stopped. Any changes will not take place while the motor is running.

PUSH BUTTON

An on-board push button is provided for the purpose of placing the Air Handler Control in different operation modes and can be used to recall stored error codes. When button is pushed and held, Air Handler Control will cycle through a menu of options depending on current operating mode. Every three seconds a new menu item will be displayed. If the button is released while that item is shown on the display, Air Handler Control will enter displayed operating mode, or execute defined operation sequence for that menu option. Once all items on menu have been displayed the menu resumes from the beginning (if button is still held).

1. Press the diagnostic push button and hold it to cycle through a menu of options. Every five seconds a new menu item will be displayed. Release the button when the desired mode is displayed.

2. When the solid “E” is displayed, the control enters the Error Code Recall mode. Error Code Recall mode menu options: No change (displaying error history) remains in Error Code Recall mode; solid “m” exits Error Code Recall mode; and solid “c” clears the error history. Must press button while flashing “c” is displayed to clear error codes

3. When the solid “.” is displayed, the control enters the applicable mode. Field configuration mode menu options: Solid “C” starts pressure switch calibration; blinking “.” exits current active mode.

JUMPERS

Jumpers are used for non-communicating mode only.

1. Humidification — Controls the status of H terminal on the thermostat block. Configurations are as follows:
   - If jumper is installed in SMART Humidification position (Default), H terminal is active if heat demand is present and indoor blower is running.
   - If jumper is installed in AUTO Humidification position, H terminal is energized whenever indoor blower is running.

2. EvenHeat — Target Discharge Air Temperature selection is used to set discharge air temperatures for EvenHeat operation.

NOTE - Optional Discharge Air Temperature Sensor, Lennox Catalog # 88K38 is REQUIRED for EVENHEAT operation and must be ordered separately.

3. Blower Only CFM — Used to select Indoor blower CFM for continuous operation.

4. Heat — Used to select Indoor blower CFM for electrical heat by placing the jumper in proper position. Actual CFM values for different air handler sizes are shown in Targeted CFM tables starting on page 25.

5. Cool — Used to select cooling indoor blower CFM by placing the jumper in proper position. Actual CFM values for different air handler sizes are shown in Targeted CFM tables starting on page 25.

6. Adjust - Used to select the indoor blower CFM adjustment value by placing the jumper in appropriate position.
   - If NORM is selected, indoor blower runs at normal speeds.
   - If + is selected, indoor blower runs at approximately 10% higher speed than NORM setting.
   - If - is selected, indoor blower runs at approximately 10% lower speed than NORM setting.

If the jumper is missing, the Air Handler Control will activate the Configuration Jumper is Missing alarm and will automatically use the default factory setting in table 10. See figure 21 for jumper configurations. Actual CFM values for different air handler sizes are shown in Targeted CFM tables starting on page 25.

7. Delay — Indoor blower cooling profile, delay for cooling and heat pump operations.
   - When operating a heat pump, delay profiles 1 and 2 are only applicable.
   - When operating a heat pump, delay profiles 3 and 4 are selected, the Air Handler Control will default to profile 1.

If the jumper is missing, the Air Handler Control will activate the Configuration Jumper is Missing alarm and will automatically use the default factory setting in table 10. See figure 21 for jumper configurations.

Delay Profile 1
A When cool or heat demand is initiated, motor ramps up to 100% and runs at 100% until demand is satisfied.
B Once demand is met, motor ramps down to stop.

Delay Profile 2
Cooling — Air Conditioner and Heat Pump:
A When cool demand is initiated, motor ramps up to 100% and runs at 100% until demand is satisfied.

Page 21
Once demand is met, motor runs at 100% for 45 seconds.

Motor ramps down to stop.

Heating — Heat Pump only:

A When heat demand is initiated, 30 seconds motor on delay starts
B After the motor on delays expires, motor ramps up to 100% and runs at 100% until demand is satisfied.
C Once demand is met, motor runs at 100% for 45 seconds.
D Motor ramps down to stop.

Delay Profile 3

A When cool demand is initiated, motor ramps up to 82%
B Motor runs at 82% for approximately 7.5 minutes and then ramp up to 100% (unless the demand has been satisfied) and motor runs at 100% until demand is satisfied.
C Once demand is met, motor runs at 50% for 30 seconds.
D Motor ramps down to stop.

Delay Profile 4

A When cool demand is initiated, motor ramps up to 50%
B Motor runs at 50% for 30 seconds and ramps up to 82%
C Motor runs at 82% for approximately 7.5 minutes and then ramp up to 100% (unless the demand has been satisfied) and motor runs at 100% until demand is satisfied.
D Motor ramps down to stop.

DISPLAY

An on-board single character LED display (see figure 21 for LED display location) indicates general system status information such as mode of operation, indoor blower CFM and error codes. Multi-character strings are displayed with character ON for one second, OFF for 0.5 seconds and one second pause between the character groups.

**NOTES** - The effect of static pressure, filter and electric heater resistance is included in the air volumes listed.

First stage cooling air volume is 70% of COOL speed setting. Continuous blower speed is approximately 50% of COOL speed setting.

Lennox Harmony III® Zone Control applications - minimum blower speed is 300 cfm (145 L/s)
## Unit Operating Sequences

This section details unit operating sequence for non-communicating systems.
*NOTE* - For communicating systems, see the icomfort Touch™ thermostat installation instruction.

</table>
This section identifies the requirements for configuring the air handler unit for unit size, heat mode selection and EvenHeat.

**Air Handler Control Checkout**

Power-up - Unit Size Code (Number or letter) displayed represents air handler model size and capacity. If three horizontal bars displays, Air Handler Control (AHC) does not recognize unit size code (air handler model size and capacity).

- **No**
  - Electric heat installed? Yes → AHC recognizes Unit Size Code? Yes → finished
  - Electric heat installed? Yes → AHC recognizes Unit Size Code? No → Display Alarm Code 203

Refer to Configuring Unit Size Codes flow diagram, Air Handler or ECB40 Electric Heat installation instructions. **IMPORTANT** — Field replacement controls may need to be manually configured to validate air handler unit size code.

- **No** → AHC recognizes Unit Size Code? Yes → finished
  - Electric heat installed? No → Electric heat installed? No (Display Alarm Code 203)

Refer to Configuring Unit Size Codes flow diagram, Air Handler or ECB40 Electric Heat installation instructions.

**Which Heat Mode?**

- Standard
- EVENHEAT

**W1 Call?**

- Yes → Refer to Heat Pump or Cooling Sequence of Operation flow diagrams, Air Handler or ECB40 Electric Heat installation instructions.
- No → Refer to EVENHEAT Operation flow diagram, Air Handler or ECB40 Electric Heat installation instructions.

**NUMBER OF HEAT SECTIONS DETECTED**

<table>
<thead>

</tbody>
</table>

**NOTE** — AHC will not recognize higher heat sections calls if lower heat section is not present.

**T−STAT CALL**

- W1
- W2
- W3

**Pilot relays on AHC are energized one at a time. There is a minimum of 10 seconds delay between pilot relay activations.**

**NOTE** — AHC will not recognize higher heat sections calls if lower heat section is not present.

- At the completion of each heat section demand (W1, W2, and W3), the AHC will immediately de-energize the corresponding pilot relay(s).
- At the completion of all heat section demands, the indoor blower will run for an additional 10 seconds before de-energizing.

A call for electric heating first, second or third stage is initiated when 24 VAC (R) is detected on W1, W2 and W3 inputs on AHC. (Factory mounted metal jumpers connect W1/2 and W2/3.

Indoor blower will immediately start to deliver CFM as set by heating mode jumper on AHC with activation of first electric heat pilot relay.

**RECOMMEND** — USE FIGURE 21 AS A REFERENCE FOR SETTING JUMPER CONFIGURATIONS ON THE AIR HANDLER CONTROL.
Configuring Unit Size Codes (Model Number)

Power-up — Unit Size Code (number or letter) displayed represents unit size code (air handler model size and capacity). If three horizontal bars display, then Air Handler Control (AHC) does not recognize unit size code.

AHC in IDLE mode (No heating, cooling or indoor fan operation)

Yes

To enter unit size code configuration mode; PUSH and HOLD button next to single character LED display until dash symbol appears, RELEASE button.

No

Turn room thermostat to OFF

UNIT SIZE CODE

0 CBX32MV-018/024
1 CBX32MV-024/030
2 CBX32MV-036
3 CBX32MV-048
4 CBX32MV-060
5 CBX32MV-068
6 CBX40UHV-024
7 CBX40UHV-030
8 CBX40UHV-036
9 CBX40UHV-042
L CBX40UHV-048
U CBX40UHV-060

1. When the correct Unit Sized Code is displayed, RELEASE push button. Selected code will flash for 10 second period.
2. During that 10 second period, HOLD push button until code stops blinking (three seconds minimum).
3. Air Handler Control will store code in memory and exit current active mode. LED display will go blank and then the Unit Size Code will display for 2 to 5 seconds.

NOTE - If 10 second period expires, or push button is held less than three seconds, control will automatically exit current active mode and go into IDLE Mode without storing unit size code. If this occurs, then Unit Size Code configuring procedure must be repeated.

LED displays correct Unit Size Code.

YES

Unit enters IDLE Mode.

NO

Figure 23. Configure Unit Size Codes
Configuring/Detecting Electric Heat Sections

IMPORTANT — All electric heat installations require the Air Handler Control (AHC) to be manually configured to detect number of heat sections.

NOTE — All field replacement AHC will require configuring/detecting electric heat sections.

RECOMMEND — USE FIGURE 21 AS A REFERENCE FOR SETTING JUMPER CONFIGURATIONS ON THE AIR HANDLER CONTROL.

Which Heat Mode?

- Set desired Heating Mode Blower Speed jumper pin.
- Electric heat is stages by room thermostat. (AHC comes with factory jumper between W1 to W2 and W2 to W3)
- Refer to Air Handler Control Checkout flow diagram for operation.

Configuration

AHC in Idle Mode (No heating cooling or indoor fan operation)

To enter electric heat mode configuration, push and hold button next to single character LED display until dash symbol (solid bar) appears, then release button.

- Solid dash starts blinking on single character LED display

Push and hold button until the solid H symbol is displayed on the single character LED display, then release button.

Yes

- Set desired Heating Mode Blower Speed jumper pin.
- Install and wire discharge air temperature sensor.
- Set desired Target Discharge Temperature jumper pin. If jumper pin is missing or discharge air temperature sensor is not detected, AHC defaults to Standard Heat Mode. Target settings are 85, 100, 115 and 130°F.
- Refer to EVENHEAT Operation flow diagram for operation.

No

Turn room thermostat to OFF.

1. AHC will start the indoor blower motor to the selected heat jumper speed setting and cycle the electric heat relays ON to automatically detect number of electric heat sections. (Electric heat section may be wired to energize more than one element)
2. AHC waits for maximum of ten seconds to detect electric heat 22 volt DC relay coils are energizing:
   A If relay coil current is detected within ten seconds, AHC will show a 1 on the single character LED display indicating that the first stage has been detected. As each additional heat section is detected, single character LED display on the AHC will display that electric element number. (Example: Last number displayed by the single character LED display is 3, the AHC is configured to operate three electric heat sections.)
   B If relay coil current is not detected within ten seconds, the AHC will exit the current active mode and resume operation with electric heat disabled.
3. AHC will automatically exit current configuration mode when configuration is completed. To verify that the number of electric sections detected matches the installed electric heat package, the field MUST CONFIRM that the last number the single character LED display before exiting the Configuring/Detection Mode matches the number of installed electric heat sections. AHC stores the number of electric heat stages in non-volatile memory.
4. After the detection is finished, unit will continue to operate for an additional 30 seconds.

NOTE — If AHC push button is pushed or power is cycled on AHC is unable to verify all 22 volt DC electric heat relay(s) were energized using electric heater detection, configuration will be stopped. Configuration function must be repeated.

Finished

                - **Yes**
                  - **More Electric Heat available**

**Note 1 Activation delay**
- 120 seconds if one heat stage is or deactivated
- 150 seconds if more than one stage is activated or deactivated.

**NOTE — Optional Outdoor Thermostat (Wired between R and W3) will lockout electric elements 3, 4 and 5.**

Figure 26. EVENHEAT Operation (2 of 2)
Heat Pump Operation (Heating and Cooling)

Air Handler Control (AHC) Indoor Blower Mode Speed and Profiles settings
1. Set Cooling Mode Blower Speed jumper pin. (Low and high indoor blower CFM settings are identical for cooling and heat pump)
2. Set Blower Adjust Selection jumper pin.
3. Set Cooling Mode Blower Ramping jumper pin (Cooling calls - All ramping profiles are active) (Heating calls - Only ramping profiles 1 and 2 are active. If profiles 3 or 4 are selected, AHC will default to profile 1)
   A Profile 1 does not provide any ramping profiles.
   B Profile 2 provides a 30 second indoor blower ON delay at the start of a heat pump heating demand. (45 second indoor blower OFF delay)
4. Simultaneous Heat Pump and electric heat call: Indoor Blower will operate at the highest CFM requested by the heat pump or the electric heat blower speed selection.

Single or Two-Stage Unit
1. AHC on-AHC link must be cut between Y1 and Y2 to allow two stage cooling operation.
2. AHC on-AHC link must be cut between R and O to allow heat pump operation.

RECOMMEND — USE FIGURE 21 AS A REFERENCE FOR SETTING JUMPER CONFIGURATIONS ON THE AIR HANDLER CONTROL.

Room thermostat calls for first stage?

Air Handler Control (AHC) receives inputs on Y1 terminal.

Y1 terminal on AHC is configured as input and passes signal from room thermostat to outdoor unit.

NOTE — The outdoor unit control directly controls the outdoor unit operation.

Y1 input to the AHC will control the indoor blower according to the cooling or heating mode blower speed, ramping and adjust selection jumper pins.

Room thermostat calls for second stage?

Yes

Y2 terminal on AHC is configured as input and passes signal from room thermostat to outdoor unit.

NOTE — The outdoor unit control directly controls the outdoor unit operation.

Yes

Y2 terminal is an input to the AHC. The indoor blower will be controlled according to the jumper pin selections.

Still calling for second stage?

No

De-energize Y2 terminal on AHC. Indoor blower speed will reset to Y1 demand.

NOTE — The outdoor unit control directly controls the outdoor unit operation.

Still calling for first stage?

No

De-energize Y1 (and O in cooling) terminals on AHC.

NOTE — The outdoor unit control directly controls the outdoor unit operation.

De-energize indoor blower per ramping profile.
Cooling Operation

Air Handler Control (AHC) Indoor Blower Mode Speed and Profiles settings
1. Set Cooling Mode Blower Speed jumper pin.
2. Set Cooling Mode Blower Ramping jumper pin.
3. Set Blower Adjust Selection jumper pin.

Single or Two-Stage Unit

AHC on-board link must be cut between Y1 and Y2 to allow 2 stage cooling operation.

RECOMMEND — USE FIGURE 21 AS A REFERENCE FOR SETTING JUMPER CONFIGURATIONS ON THE AIR HANDLER CONTROL.

Y1 input to the AHC will control the indoor blower according to the cooling or heating mode blower speed, ramping and adjust selection jumper pins.

IMPORTANT — Use care when cutting links to prevent damage to control. See figure 21, CBK32MV jump and link guide for further details.
**Error Code / Recall Mode**

To enter Error Code Mode, push and hold button next to single character LED display until solid E symbol appears, release button.

Control will display up to ten error codes stored in memory. If E 0 0 0 is displayed, there are no stored error codes.

To exit Error Code Recall Model, push and hold button next to single character LED display until solid three horizontal bars appears, then release button.

NOTE — Error Codes are not cleared from memory.

AHC in Idle Mode (No heating cooling or indoor fan operation)

Turn room thermostat to OFF

To clear error codes stored in memory, continue to hold push button while the solid three horizontal bars are displayed. Release button when solid is displayed.

Solid c starts blinking on single character LED display.

The display will blink for up to ten seconds. During this time, press the button and release to confirm deletion of the error code history. As confirmation, AHC will display 0 0 0 0. (If ten second period expires or push button is not released, control will automatically exit Error Code Mode and go into mode without deleting error code history.

NOTE — Once the error code history is deleted, it cannot be recovered.

NOTE /C0266 Once the error code history is deleted, it cannot be recovered.
Indoor Blower Test

To indoor blower test mode, push and hold button next to single character LED display until — (Solid bar), then release button.

Turn room thermostat to OFF.

Push and hold button until the solid A symbol is displayed on the single character LED display, then release button.

Control will cycle the indoor blower motor for ten seconds at 70% of maximum air for selected capacity size unit. Control will indoor blower test mode.

Checkout Procedures

NOTE − Refer to outdoor unit installation instructions for system start-up instructions and refrigerant charging instructions.

PRE-START-UP CHECKS
- Is the air handler properly and securely installed?
- If horizontally configured, is the unit sloped up to 1/4 inch toward drain lines?
- Will the unit be accessible for servicing?
- Has an auxiliary pan been provided under the unit with separate drain for units installed above a finished ceiling or in any installation where condensate overflow could cause damage?
- Have ALL unused drain pan ports been properly plugged?
- Has the condensate line been properly sized, run, trapped, pitched, and tested?
- Is the duct system correctly sized, run, sealed, and insulated?
- Have all cabinet openings and wiring been sealed?
- Is the indoor coil factory-installed TXV properly sized for the outdoor unit being used?
- Have all unused parts and packaging been disposed of?
- Is the filter clean, in place, and of adequate size?
- Is the wiring neat, correct, and in accordance with the wiring diagram?
- Is the unit properly grounded and protected (fused)?
- Is the thermostat correctly wired and in a good location?
- Are all access panels in place and secure?

CHECK BLOWER OPERATION
- Set thermostat to FAN ON.
- The indoor blower should come on.

CHECK COOLING OPERATION
- Set thermostat to force a call for cooling (approximately 5°F lower than the indoor ambient temperature).
• The outdoor unit should come on immediately and the indoor blower should start between 30 - 60 seconds later.
• Check the airflow from a register to confirm that the system is moving cooled air.
• Set the thermostat 5°F higher than the indoor temperature. The indoor blower and outdoor unit should cycle off.

CHECK ELECTRIC HEATER (IF USED)
• Set thermostat to call for auxiliary heat (approximately 5°F above ambient temperature). The indoor blower and auxiliary heat should come on together. Allow a minimum of 3 minutes for all sequencers to cycle on.
• Set the thermostat so that it does not call for heat. Allow up to 5 minutes for all sequencers to cycle off.

Operation

COOLING (COOLING ONLY OR HEAT PUMP)
When the thermostat calls for cooling, 24 volts is put on the blower time-delay relay coil. After a delay, the indoor blower relay energizes. The normally open contacts close, causing the indoor blower motor to operate. The circuit between R and Y is completed, closing the circuit to the contactor in the outdoor unit, starting the compressor and outdoor fan motor.

On heat pumps, circuit R and O energizes the reversing valve, switching the valve to the cooling position. (The reversing valve remains energized as long as the thermostat selector switch is in the COOL position.)

At the completion of the cooling demand and after the relay’s time-delay, the compressor and outdoor fan will cycle off.

HEATING (ELECTRIC HEAT ONLY)
When the thermostat calls for heat, the circuit between R and W is completed, and the heat sequencer is energized. A time delay follows before the heating elements and the indoor blower motor come on. Units with a second heat sequencer can be connected with the first sequencer to W on the thermostat subbase, or they may also be connected to a second stage on the subbase.

HEATING (HEAT PUMP)
When the thermostat calls for heating, 24 volts is put on the blower time-delay relay coil. After a delay, the normally open contacts close, causing the indoor blower motor to operate. The circuit between R and Y is completed, closing the circuit to the contactor in the outdoor unit, starting the compressor and outdoor fan motor. Circuit R and G energizes the blower relay, starting the indoor blower motor.

If the room temperature should continue to fall, the circuit between R and W1 is completed by the second-stage heat room thermostat. Circuit R-W1 energizes a heat sequencer. The completed circuit will energize supplemental electric heat (if applicable). Units with a second heat sequencer can be connected with the first sequencer to W1 on the thermostat. They may also be connected to a second heating stage W2 on the thermostat subbase.

EMERGENCY HEAT (HEATING HEAT PUMP)
If the selector switch on the thermostat is set to the emergency heat position, the heat pump will be locked out of the heating circuit, and all heating will be electric heat (if applicable). A jumper should be placed between W2 and E on the thermostat subbase so that the electric heat control will transfer to the first-stage heat on the thermostat. This will allow the indoor blower to cycle on and off with the electric heat when the fan switch is in the AUTO position.

Maintenance

DEALER

WARNING
Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

WARNING
Improper installation, adjustment, alteration, service or maintenance can cause personal injury, loss of life, or damage to property. Installation and service must be performed by a licensed professional installer (or equivalent) or a service agency.

Maintenance and service must be performed by a qualified installer or service agency. At the beginning of each cooling season, the system should be checked as follows:

Outdoor Unit
1. Outdoor unit fan motor is pre-lubricated and sealed. No further lubrication is needed.
2. Visually inspect all connecting lines, joints and coils for evidence of oil leaks.
3. Check all wiring for loose connections.
4. Check for correct voltage at unit (unit operating).
5. Check amp draw on outdoor fan motor.

Motor Nameplate:_________ Actual:_________.
6. Inspect drain holes in coil compartment base and clean if necessary.

NOTE - If insufficient cooling occurs, the unit should be gauged and refrigerant charge should be checked.

Outdoor Coil
Clean and inspect outdoor coil (may be flushed with a water hose). Ensure power is off before cleaning.

NOTE — It may be necessary to flush the outdoor coil more frequently if it is exposed to substances which are corrosive or which block airflow across the coil (e.g., pet urine, cottonwood seeds, fertilizers, fluids that may contain high levels of corrosive chemicals such as salts)

Page 37
Sea Coast — Moist air in ocean locations can carry salt, which is corrosive to most metal. Units that are located near the ocean require frequent inspections and maintenance. These inspections will determine the necessary need to wash the unit including the outdoor coil. Consult your installing contractor for proper intervals/procedures for your geographic area or service contract.

Indoor Unit
1. Clean or change filters.
2. Lennox blower motors are prelubricated and permanently sealed. No more lubrication is needed.
3. Adjust blower speed for cooling. Measure the pressure drop over the coil to determine the correct blower CFM. Refer to the unit information service manual for pressure drop tables and procedure.
4. Belt Drive Blowers - Check belt for wear and proper tension.
5. Check all wiring for loose connections.
6. Check for correct voltage at unit. (blower operating)
7. Check amp draw on blower motor.
   Motor Nameplate:_________ Actual:_________.

Indoor Coil
1. Clean coil if necessary.
2. Check connecting lines, joints and coil for evidence of oil leaks.
3. Check condensate line and clean if necessary.

Cabinet Insulation

⚠️ IMPORTANT

DAMAGED INSULATION MUST BE REPAIRED OR REPLACED before the unit is put back into operation. Insulation loses its insulating value when wet, damaged, separated or torn.

Matt- or foil-faced insulation is installed in indoor equipment to provide a barrier between outside air conditions (surrounding ambient temperature and humidity) and the varying conditions inside the unit. If the insulation barrier is damaged (wet, ripped, torn or separated from the cabinet walls), the surrounding ambient air will affect the inside surface temperature of the cabinet. The temperature/humidity difference between the inside and outside of the cabinet can cause condensation on the inside or outside of the cabinet which leads to sheet metal corrosion and subsequently, component failure.

REPAIRING DAMAGED INSULATION
Areas of condensation on the cabinet surface are an indication that the insulation is in need of repair.

If the insulation in need of repair is otherwise in good condition, the insulation should be cut in an X pattern, peeled open, glued with an appropriate all-purpose glue and placed back against the cabinet surface, being careful to not overly compress the insulation so the insulation can retain its original thickness. If such repair is not possible, replace the insulation. If using foil-faced insulation, any cut, tear, or separations in the insulation surface must be taped with a similar foil-faced tape.

![Repairing Insulation Diagram]

Electric Shock Hazard.
Can cause injury or death.
Foil-faced insulation has conductive characteristics similar to metal. Be sure there are no electrical connections within a ½” of the insulation. If the foil-faced insulation comes in contact with electrical voltage, the foil could provide a path for current to pass through to the outer metal cabinet. While the current produced may not be enough to trip existing electrical safety devices (e.g. fuses or circuit breakers), the current can be enough to cause an electric shock hazard that could cause personal injury or death.

HOMEOWNER
Cleaning of the outdoor unit’s coil should be performed by a trained service technician. Contact your dealer and set up a schedule (preferably twice a year, but at least once a year) to inspect and service your outdoor unit. The following maintenance may be performed by the homeowner.
**CAUTION**

Physical contact with metal edges and corners while applying excessive force or rapid motion can result in personal injury. Be aware of, and use caution when working near these areas during installation or while servicing this equipment.

**IMPORTANT**

Sprinklers and soaker hoses should not be installed where they could cause prolonged exposure to the outdoor unit by treated water. Prolonged exposure of the unit to treated water (i.e., sprinkler systems, soakers, waste water, etc.) will corrode the surface of steel and aluminum parts and diminish performance and longevity of the unit.

Outdoor Coil

The outdoor unit must be properly maintained to ensure its proper operation.

- Please contact your dealer to schedule proper inspection and maintenance for your equipment.
- Make sure no obstructions restrict airflow to the outdoor unit.
- Grass clippings, leaves, or shrubs crowding the unit can cause the unit to work harder and use more energy.
- Keep shrubbery trimmed away from the unit and periodically check for debris which collects around the unit.

Routine Maintenance

In order to ensure peak performance, your system must be properly maintained. Clogged filters and blocked airflow prevent your unit from operating at its most efficient level.

1. **Air Filter** — Ask your Lennox dealer to show you where your indoor unit’s filter is located. It will be either at the indoor unit (installed internal or external to the cabinet) or behind a return air grille in the wall or ceiling. Check the filter monthly and clean or replace it as needed.

2. **Disposable Filter** — Disposable filters should be replaced with a filter of the same type and size.

3. **Reusable Filter** — Many indoor units are equipped with reusable foam filters. Clean foam filters with a mild soap and water solution; rinse thoroughly; allow filter to dry completely before returning it to the unit or grille.

**NOTE** — If you are unsure about the filter required for your system, call your Lennox dealer for assistance.

4. **Electronic Air Cleaner** — Some systems are equipped with an electronic air cleaner, designed to remove airborne particles from the air passing through the cleaner. If your system is so equipped, ask your dealer for maintenance instructions.

5. **Indoor Unit** — The indoor unit’s evaporator coil is equipped with a drain pan to collect condensate formed as your system removes humidity from the inside air. Have your dealer show you the location of the drain line and how to check for obstructions. (This would also apply to an auxiliary drain, if installed.)

Thermostat Operation

See the ComfortSense® 7000 or icomfort Touch™ thermostat homeowner manual for instructions on how to operate your thermostat.

Preservice Check

If your system fails to operate, check the following before calling for service:

- Verify room thermostat settings are correct.
- Verify that all electrical disconnect switches are ON.
- Check for any blown fuses or tripped circuit breakers.
- Verify unit access panels are in place.
- Verify air filter is clean.
- If service is needed, locate and write down the unit model number and have it handy before calling.
